## I. EXISTING CONDITIONS

### A. Project Overview

A new institutional development, known as the Chapel Hill Cooperative Preschool, located along Mount Carmel Church Road near its intersection with US Highway 15-501 is being proposed in Chapel Hill. The project proposes to construct a 9,000 square feet preschool with an ultimate student population of 100 and 22 staff (originally studied as 80 students and 20 staff) on several existing parcels on the north side of Mt. Carmel Church Road. **Figure 1** (found in **Appendix A**) shows the general location of the site. The project is anticipated to be fully complete by 2018. This report analyzes the complete build-out scenario for the year 2019 (one year after anticipated completion), the no-build scenario for 2019, a 2022 future scenario to include the full effects of the nearby Obey Creek development, as well as 2017 existing year traffic conditions.

The proposed site concept plan shows a single restricted movement access driveway (right-turn in/right-turn out only) along Mt. Carmel Church Road. No other vehicular access connections are proposed. **Figure 2** displays the preliminary site plan for the Chapel Hill Cooperative Preschool and nearby land uses and roadways. The project is expected to provide 37 parking spaces and eight parent drop-off parking stalls on surface parking lots.

### B. Site Location and Study Area

This report analyzes and presents the transportation impacts that the Chapel Hill Cooperative Preschool will have on the following intersections in the project study area:

- US 15-501 and Mt. Carmel Church Road / Culbreth Road
- US 15-501 and Arlen Park Drive / Bennett Road
- Mt. Carmel Church Road and Bennett Road
- Mt. Carmel Church Road and proposed Site Driveway (Right-turn In/Right-turn Out Only)

The impacts of the proposed site at the study area intersections were evaluated during the AM, noon, and PM peak hours of an average weekday.

There are no Town-approved/recently completed developments in the immediate project study area that were considered to be fully built-out by 2019 that are expected to generate additional background traffic to the project study area. There are multiple locations located beyond the study area that are either approved or currently in the development review process that may also contribute to background traffic growth. To account for this, an area-wide ambient future traffic growth percentage of 1.2 percent per year was applied to the existing 2017 volumes, based on historical average annual daily traffic (AADT) growth rate data provided by the Town of Chapel Hill and the North Carolina Department of Transportation (NCDOT), and consistent with recent traffic impact studies near the project study area.

To account for future potential impacts of full build-out of the Obey Creek development, a 2022 analysis scenario was included in this study that includes background traffic volumes projected for the Obey Creek development as analyzed in the *Obey Creek Mixed-Use Development Traffic Impact Study* (HNTB, 2014).

### C. Site Description

The Chapel Hill Cooperative Preschool site currently contains several wooded land parcels that are mostly undeveloped. It borders residential neighborhoods to the east and south and the US 15-501 highway corridor to the west. It is located immediately adjacent to Morgan Creek and Town-owned institutional lands to the north.

All vehicular access will utilize Mt. Carmel Church Road via a proposed restricted access site driveway that limits movements to right-turns in and

right-turns out through the use of a proposed concrete median along Mt. Carmel Church Road. The proposed site plan, shown in **Figure 2**, indicates all parking will be accommodated on-site, with paved surface parking facilities. No other specific transportation improvements are shown on the site plan, with the exception of a note that the site would have a future easement for a connection to the Morgan Creek Greenway trail system.

**Chapel Hill Cooperative Preschool Site  
(Google Earth Aerial Image, 2017)**

### D. Existing and Proposed Uses in Vicinity of Site

The land uses and development in the study area along Mt Carmel Church Road are primarily residential. The Existing Land Use Plan shown in the 2020 *Town of Chapel Hill Comprehensive Plan* and adopted June 25, 2012, indicates that the proposed site is designated as "Low Density Residential – 1-4 units/acre". The Future Land Use Plan, that is also a part of the Town Comprehensive Plan, indicates that the parcel would continue to be designated as "Low Density Residential, 1-4 units/acre". The parcel is currently zoned "R-1" – delineating it as "Residential – 3 units/acre". Institutional uses, such as preschools, are permitted uses within residentially zoned land

### E. Existing and Committed Surface Transportation Network

#### Roadways

The Chapel Hill Cooperative Preschool project study area features three major arterial roadways serving areas throughout the Town of Chapel Hill and points beyond, as well as some smaller collector and local access streets. **Table 1**, on the following page, summarizes pertinent information on the study area roadway facilities. Average Annual Daily Traffic (AADT) data was taken from 2015 AADT mapping produced by the NCDOT Traffic Survey Unit. **Figure 3** shows the existing lane configuration, traffic control, and speed limits for these study area roadways.

Detailed descriptions of several of the major study area roadways are as follows:

- **US 15-501** is a major north-south arterial that provides regional connectivity between Pittsboro, Chapel Hill and Durham. In the study area, US 15-501 is a divided facility south of the NC 54 Bypass interchange, and features a 35 mph speed limit through the project study area. Several bus stops are located along the facility, along with pedestrian sidewalk.

**Table 1. Existing Study Area Roadways**

| Road Name             | Functional Class*        | Study Area Cross-Section            | 2015 AADT     | Speed Limit | Sidewalk | On-Street Parking |
|-----------------------|--------------------------|-------------------------------------|---------------|-------------|----------|-------------------|
| US 15-501             | Other Principal Arterial | 4 lane divided / 5 lane undivided   | 26,000-41,000 | 35          | Y        | N                 |
| Culbreth Road         | Minor Collector          | 3 lane undivided + center turn lane | 4,900         | 35          | Y        | N                 |
| Mt Carmel Church Road | Minor Arterial           | 2 lane undivided                    | 9,900         | 35          | N        | N                 |
| Arlen Park Drive      | Local                    | 2 lane divided                      | N/A           | 25          | S        | S                 |
| Bennett Road          | Local                    | 2 lane undivided                    | N/A           | 35          | N        | N                 |

S = Some Sidewalk/Parking Present \* - As defined on the *NCDOT Urban Functional Classification Map (2017)*.

<https://ncdot.maps.arcgis.com/home/webmap/viewer.html>

- **Culbreth Road** is a local study area facility, serving Culbreth Middle School and other development between US 15-501 and Smith Level Road. In the study area vicinity, Culbreth Road is a three-lane undivided roadway with a center left-turn lane. There are several driveway access points along the roadway. On-street parking is not permitted. Several CHT bus stops are located along the facility and the facility is designated as a North Carolina Bike Route (Route 2). The posted speed limit is 35 mph in the project study area.
- **Mt. Carmel Church Road** is designated as a minor arterial facility that serves mostly residential developments to the south and east of the project study area. This roadway also provides linkage between the US 15-501 corridor and the Governor's Club area into Chatham County. The facility has a posted speed limit of 35 mph with no sidewalk present and on-street parking not permitted. It also is designated as NC Bike Route 2 in the project study area.
- **Bennett Road** is a local access street that connects US 15-501 and Mt. Carmel Church Road, serving several residential neighborhoods and a Town Fire Station. The posted speed limit is 35 mph on Bennett Road, with no pedestrian or bicycle facilities present. Some on-street parking is permitted east of the project study area.
- **Arlen Park Drive** are local access streets to and from US 15-501 for commercial and residential developments in the Southern Village neighborhood. These facilities have two travel lanes with some sections of on-street parking and sidewalk. Posted speed limits are 25 mph.

#### **Intersections**

**Table 2** summarizes all three existing study area intersections, traffic control features, and pedestrian amenities at each. Laneage details and intersection turn bay lengths are also detailed on **Figure 3**.

The project study area features a mixture of signalized intersections at major intersections along the US 15-501 corridor and unsignalized intersections at minor local access street and private driveway connections. The US 15-501 corridor features coordinated signal operation for weekday peak hours.

**Table 2. Existing Study Area Intersection Details**

| Intersection   | Traffic Control | Signal Phases | Signal Operation | Cross walk | Ped Signals |
|--|-----------------|---------------|------------------|------------|-------------|
| US 15-501 and Mt. Carmel Church Road / Culbreth Road | Signal          | 8             | Coordinated      | Yes        | Yes (1)     |
| US 15-501 and Arlen Park Drive / Bennett Road        | Signal          | 3             | Coordinated      | Yes        | Yes (2)     |
| Mt. Carmel Church Road and Bennett Road              | TWSC            | N/A           | N/A              | No         | No          |

TWSC = Two-Way Stop-Controlled

Ped Signals (Number of Approaches Featuring Signals)

### **Bicycle Routes and Sidewalks**

Specific bicycle facilities (bike lanes) are present in the immediate study area along US 15-501. Pedestrian sidewalk exists along the west side of US 15-501 through the study area. Crosswalks and pedestrian signals are present in at least one quadrant at the Mt. Carmel Church Road / Culbreth Road and Bennett Road / Arlen Park Drive intersections. The Morgan Creek greenway currently connects to US 15-501 and Culbreth Road in the western portion of the project study area. **Figure 4** displays a schematic of existing pedestrian/bicycle facilities in the project study area.

### **Transit Routes**

Current Chapel Hill Transit (CHT) local Routes D, NS, and V serve the project study area along US 15-501 and Culbreth Road with weekday bus service. Express CHT Route CCX also traverses the project study area roadways. Several bus stops, with a range of amenities (shelters, benches), are present in the study area. There are no pedestrian connections (sidewalk, crossing at US 15-501 and Mt Carmel/ Culbreth) between the site and bus stops. **Table 3** details the four current CHT routes serving the study area. Most buses run on 10 minute, 30 minute, or hour headways during weekday peak service periods. **Figure 5** displays transit routes and bus stops that currently exist in the project study area. Transit trips that may be generated by the Chapel Hill Cooperative Preschool site are discussed in the following sections of this report.

### **Recommended/Committed Surface Transportation Improvement Projects**

NCDOT is scheduled to construct STIP U-5854 intersection improvements (single-lane roundabout) at the Mt. Carmel Church Road / Bennett Road intersection in 2018. This project was included in all future year analyses, and was included as a comparison to existing conditions and traffic control for all scenarios. The Town of Chapel Hill has recently completed a laneage conversion along Mt. Carmel Church Road at the US 15-501 intersection, along with signal phasing and timing upgrades (all data and analyses completed for this study include this project as being complete for existing conditions).

There are no other committed/programmed NCDOT STIP projects, Town of Chapel Hill transportation improvement projects, or private development-related projects to improve roadway facilities in the study area that are expected to be complete by the 2019 design year. For the 2022 analysis year, additional mitigation improvements were recommended as part of the Obey Creek development process. One recommended improvement from that study was the recently completed Mt. Carmel Church restriping / signal upgrade described above. Additional improvements from that study are located outside the immediate project study area for this report.

NCDOT has on-going planning and feasibility studies (STIP U-5304A) for the US 15-501 and NC 54 Bypass corridors, but no recommendations have been made or approved from these studies and no assumptions related to potential improvements from those studies were made for this report.

**Table 3. Current Study Area Weekday Transit Service**

| Route                       | Headways (minutes) |         |          | Study Area Stops                                     | Destinations  |
|-----------------------------|--------------------|---------|----------|--|---|
|                             | AM Peak            | PM Peak | Off Peak |  |   |

\* - Source: Chapel Hill Transit 2017 Fall Ride Guide

## F. Existing Traffic Conditions

Figure 6 shows the existing AM, noon, and PM peak hour traffic volumes for the study area intersections. The turning movement counts used to determine these volumes were conducted in October 2017 for the study area intersections during the weekday periods 7:00 - 9:00 AM, 11:30 AM – 1:30 PM, and 4:00 – 6:00 PM. Traffic counts were conducted after the recent Mt. Carmel Church Road resurfacing project that included signal operational upgrades to the US 15-501 and Mt. Carmel Church Road / Culbreth Road intersection. All turning movement count output is found in **Appendix B**.

Traffic count information shows traffic flows on US 15-501 were heavy during the AM and PM peak count periods, with northbound flows into downtown Chapel Hill heaviest in the AM peak and southbound return flows heaviest in the PM peak. Traffic flows on Mt. Carmel Church Road and Culbreth Road were moderate to heavy during the peak commuting periods. Traffic flows on Bennett Road and Arlen Park Road were light to moderate during all peak periods. Table 4 provides a detailed listing of each intersection count, peak hour, and count date.

**Table 4. Traffic Count Information**

| Traffic Count Location                               | Period Counted | Peak Hour           | Count Date |
|--|----------------|---------------------|------------|
| US 15-501 and Mt. Carmel Church Road / Culbreth Road | AM Peak        | 7:30 - 8:30 AM      | 10/11/17   |
|  | Noon Peak      | 12:15 AM - 1:15 PM  |            |
|  | PM Peak        | 4:30 - 5:30 PM      |            |
| US 15-501 and Arlen Park Drive / Bennett Road        | AM Peak        | 7:15 - 8:15 AM      | 10/11/17   |
|  | Noon Peak      | 12:00 AM - 1:00 PM  |            |
|  | PM Peak        | 4:30 - 5:30 PM      |            |
| Mt. Carmel Church Road and Bennett Road              | AM Peak        | 7:30 - 8:30 AM      | 10/11/17   |
|  | Noon Peak      | 11:45 AM - 12:45 PM |            |
|  | PM Peak        | 4:45 - 5:45 PM      |            |

## II. 2019 BUILD-OUT YEAR+1 & 2022 FUTURE YEAR CONDITIONS

### A. Future Ambient Area-Wide Traffic Growth Estimation

Based on information on average daily traffic collected by the Town of Chapel Hill and the NCDOT, a yearly ambient traffic growth rate of 1.2 percent per year was used for the short-term 2019 and 2022 design year capacity analyses. This rate is based on previous and anticipated growth trends for this area from Town and NCDOT average daily traffic information from the period 1990-2015, and matches detailed long-range growth estimates made for the *Obey Creek Mixed-Use Development Traffic Impact Study*, prepared by HNTB in April 2014.

### B. Approved Background Development Traffic Estimation

Per information from Town of Chapel Hill staff and information from the Town's Planning Department Development Activity Map (current as of October 2017), no Town-approved developments that are either currently under construction or are expected to be built out and fully operational by the 2019 design analysis year exist within the specific project study area. Thus, for 2019 background traffic growth, only ambient area-wide growth projections will be used. **Figure 7** shows the estimated 2019 Build-out Year+1 peak hour estimated traffic volumes without the Chapel Hill Cooperative Preschool development.

The Obey Creek development was not specifically included in the 2019 background traffic growth calculations for this study, as it is not expected to be generating significant levels of traffic in that short term. However, to consider the effects of the Obey Creek development on the project study area transportation system, a 2022 analysis year was included in this study. 2022 matches the build-out analysis year of the Obey Creek site used for its traffic impact study, completed in 2014. No other Town-approved developments were considered for the 2022 future year analysis.

**Figure 11** shows the estimated 2022 future year peak hour specific background generator (Obey Creek) traffic volume projections. **Figure 12** shows the estimated 2022 future peak hour total traffic volume projections with the preschool site traffic included.

### C. Proposed Project Traffic

#### i. Trip Generation

Projected trips for the proposed preschool were generated based on several sources of information, including:

- *ITE Trip Generation Manual* (Institute of Transportation Engineers, 9<sup>th</sup> Edition, 2013).
- NCDOT Municipal and School Transportation Assistance (MSTA) School Traffic Calculator (Version 110115, NCDOT, 2015)
- Applicant Trip Generation Data from the two existing Cooperative Preschool Sites (Collected October 3-5, 2016) – contained in “Narrative Describing Proposed Chapel Hill Cooperative Preschool” (Phillip Post & Associates/Pennoni, November 2016)

All trip generation raw output calculation sheets and background information are found in **Appendix C**.

**Table 5** shows a comparison of the number of vehicular trips generated by the Chapel Hill Cooperative Preschool during the weekday AM, noon, and PM peak hours, based on the generation methodologies described above. A peak hour truck percentage of two percent was

estimated for all site-generated traffic. The following observations and conclusions were made from a comparison of the data sources, methodologies and projected daily and peak hour trip estimates:

**ITE Trip Generation Data** – ITE methodologies are available for calculation of generated trips by using the number of students, number of faculty/staff, and gross floor area of a day care center (Land Use Code 565). No ITE land use code for “preschool” exists, though through review of the existing information related to the Chapel Hill Cooperative Preschool available on their website (<http://www.chapelhillcoop.com/>) and through review of materials submitted by the Applicant for this project, the current facilities and future new facility will operate in a very similar fashion to a day care center facility and not a traditional elementary school (that may have preschool classes).

NCDOT recommends the use of the number of projected students as the most applicable trip-generating variable, which if compared to actual Applicant count information expanded to the ultimate 100 students/22 staff, is very similar for daily and peak hour generation estimates. The number of faculty/staff and gross floor area variables produce higher daily and peak hour trip estimates.

**NCDOT MSTA Trip Generation Data** – NCDOT MSTA calculations for AM and PM school trips generated include public/private and urban charter school categories. Utilizing the elementary school data inputs for 100 students and 22 staff, results in **Table 5** show the Urban Charter-type school generating consistently higher trips. It is important to note that these trip rates (and estimated queue data for internal parking and circulation at schools) were developed based on traditional school peak hour data and not adjacent street peak hour data, which was utilized for both the ITE and Applicant provided data sets. The results, when compared to the other two data sets are consistently higher in the AM peak and slightly lower in the PM peak.

**Applicant-Provided Data** – The Applicant provided trip generation data for three consecutive weekdays in October 2016. Trip generation data collected was done by parent and staff signing in and out when dropping children off/picking children up or arriving at work/leaving work. Parent trips for each 10 minute time period were considered to both be “entering” and “exiting” for each trip noted in the tally sheet. A summation of trips during peak hours of the adjacent streets (computed by actual field-collected traffic count data) was reported in **Table 5** and then expanded to the ultimate capacity of 100 students and 22 staff by using a 1.25 growth factor on the existing data sets.

The resulting projections were compared to the ITE and MSTA data. Since the actual collected trip-making patterns throughout the day provide a more realistic source of trip generation information than the ITE and MSTA methodologies, it was decided to use the actual data expanded to the ultimate preschool capacity as the trip generation estimates for this study. The ITE data provides close correlation with the Applicant provided data. The MSTA data, though having close correlation for some time periods, is based on a different pattern of activity and land use function – as was mentioned before the Chapel Hill Cooperative Preschool will function more closely to a “day care” facility than a traditional elementary school.

**Table 5. Weekday Daily and Peak Hour Vehicle Trip Generation Summary**  
**Chapel Hill Cooperative Preschool**

| Generation Estimator  | LUC Code                | Density  | Daily |      |       | AM Peak Hour |      |       | Noon Peak Hour |      |       | PM Peak Hour |      |       |  |  |
|---|-------------------------|----------|-------|------|-------|--------------|------|-------|----------------|------|-------|--------------|------|-------|--|--|
|   |                         |          | Enter | Exit | Total | Enter        | Exit | Total | Enter          | Exit | Total | Enter        | Exit | Total |  |  |
| ITE - Number of Students (NCDOT Recommended)                  | 565                     | 100      | 219   | 219  | 438   | 42           | 38   | 80    | 11             | 10   | 21    | 38           | 43   | 81    |  |  |

Notes: No Noon Peak Hour ITE or MSTA Trip Generation Data Available – Assume 25% of AM Peak Hour Trips

Data from Applicant Corresponds to Peak of Hour Adjacent Street Traffic, Similar to ITE Data

## **ii.) Adjustments to Trip Generation Rates**

Raw ITE trip generation estimates for daily and peak hour trips have the potential to be adjusted for the following factors to reduce raw trip generation estimates to actual estimated vehicular trips produced by the Chapel Hill Cooperative Preschool development.

### a.) Internal Capture

The land uses proposed for Chapel Hill Cooperative Preschool development would not exhibit the potential for internally-captured trips for the singular preschool land use. No modifications or reductions were made to trip generation results to account for internal capture.

### b.) Modal Split

The study area is served by several CHT fixed bus routes with frequent existing service and also has facilities for pedestrians and bicyclists with connectivity to trip attractions in downtown Chapel Hill, the UNC Main Campus and areas of Southern Chapel Hill. However, there are no immediate pedestrian/bicycle facilities along Mt. Carmel Church Road immediately adjacent to the site. The trip generation for a day care/preschool type facility would almost exclusively be by motorized transportation, considering the ages of the students and location of the proposed facility. To provide a conservative estimate of vehicular trips, no adjustments to trip generation rates were made for transit, pedestrian, or bicycle trips.

### c.) Pass-by Trips

The proposed preschool would not be a land use typically considered for “pass-by” trips. No adjustments were made for “pass-by” trip-making.

### d.) Trip Generation Budget

Current information from the Applicant about the Chapel Hill Cooperative Preschool indicates that the project will be built out in one phase. No adjustments or recommendations for a trip generation budget are made for this study if the development is ultimately built to the building size and student population/staff size densities listed by the Applicant.

## **iii.) Trip Distribution**

Trip distribution for site-related traffic was based on existing daily and peak hour traffic patterns and engineering judgment to determine the directional peak hour characteristics of traffic to and from the site from the major study area thoroughfares. It was assumed that a majority of trips entering the site from US 15-501 would use Mt. Carmel Church Road and make a u-turn at the proposed roundabout at Bennett Road to complete this maneuver. The possibility exists that these trips could turn into Old Bridge Lane or Mallard Court to complete a u-turn maneuver, but the difficulty in making this maneuver compared to using the efficiency of the roundabout would likely result in a minimal number of trips attempting to use local streets. A small number of trips were distributed to/from the Bennett Road connection between US 15-501 and Mt. Carmel Church Road as an alternative route. No trips exiting the site were assumed to u-turn at US 15-501 from Mt. Carmel Church Road. Any site-related traffic needing to utilize Mt. Carmel Church Road to the Chatham County/Governors Club area was assumed to use US 15-501 to Bennett Road back to Mt. Carmel Church Road.

No local trips to/from lower volume residential streets were estimated, though the possibility exists a small portion of trip-making may occur to/from these local streets. Basic distribution estimates for the proposed Chapel Hill Cooperative Preschool utilized existing peak hour turning movement counts, overall daily traffic volumes along the higher volume arterial and collector streets, and a spatial sense of the location of the preschool in relation to the overall Town of Chapel Hill urbanized

area to estimate a basic distribution of trips that would be consistent for all three peak analysis hours. **Figure 8** presents the projected trip distribution percentages for the proposed site in 2019.

#### **iv.) Trip Assignment**

**Figure 9** shows the corresponding site traffic volumes distributed on the 2019 study area network. Total volumes into and out of the site correspond to total external vehicular trips generated, based on the trip generation methodology developed previously. Site traffic assignments for the 2022 future analysis year were assumed to remain the same as the 2019 Build-out Year+1 projections.

### **D. Future Traffic Forecasts with the Proposed Development**

**Figure 10** displays the 2019 Build-out+1 year projected study area traffic volumes with site traffic added. These traffic volumes represent the aggregate traffic growth over existing traffic volumes for ambient traffic growth and estimated site traffic assignments for the Chapel Hill Cooperative Preschool. **Figure 12** displays the 2022 Future Year projected study area traffic volumes that also include site traffic along with ambient area-wide traffic growth over a five year period and the Obey Creek full build-out peak hour site traffic assignments. **Appendix D** contains all information related to the development of traffic volumes and turning movements for all scenarios studied in this report.

## **III. IMPACT ANALYSES**

### **A. Peak Hour Intersection Level of Service Analysis**

#### **i.) Methodology**

Evaluation of traffic operations on suburban arterial and collector street facilities is most effective through the determination of level of service (LOS) criteria. The concept of level of service correlates qualitative aspects of traffic flow to quantitative terms. This enables transportation professionals to take the qualitative issues, such as congestion and substandard geometrics at intersections, and translate them into measurable quantities, such as operating speeds and vehicular delays. The 2010 *Highway Capacity Manual (HCM 2010)* characterizes level of service by letter designations A through F. Level of service A represents ideal low-volume traffic operations, and level of service F represents over-saturated high-volume traffic operations. Level of service is measured differently for various roadway facilities, but in general, level of service letter designations for signalized and unsignalized intersections are described by the following in **Table 6**.

The *Synchro Professional Version 9* operations analysis software was used to analyze peak hour conditions at signalized and unsignalized intersections. Synchro has the ability to analyze unsignalized intersections using HCM methodologies and computations. To analyze the future roundabout at Mt. Carmel Church Road and Bennett Road in the project study area, the SIDRA roundabout analysis software tool was used. The minimum acceptable peak hour intersection level of service established for this project is LOS D for signalized intersections or LOS E for critical movements at unsignalized intersections, or no increase in delay for signalized intersections operating below LOS D or unsignalized intersection critical movements operating below LOS E without the inclusion of site traffic. The basis for these thresholds is provided by the *Town of Chapel Hill Guidelines for the Preparation of Traffic Impact Analyses* and is consistent with NCDOT traffic impact analysis procedures. The following five conditions were evaluated:

**Condition 1 – 2017 Existing Traffic**

**Condition 2 - 2019 Traffic without Site Traffic**

**Condition 3 - 2019 Traffic with Site Traffic Volumes Added**

**Condition 4 - 2019 Traffic with Site Traffic and Mitigation Improvements**

**Condition 5 – 2022 Traffic with Site Traffic and Future Obey Creek Development Traffic**

**Table 6. Level of Service (LOS) Characteristics**

| Level of Service Description  | Per Vehicle Delay at Signal | Per Vehicle Delay at Stop Sign |
|---|-----------------------------|--------------------------------|
| <b>LOS A</b> <ul style="list-style-type: none"><li>➤ Free flow</li><li>➤ Freedom to select desired speed and to maneuver is extremely high</li><li>➤ General level of comfort and convenience for motorists is excellent</li></ul>  | < 10.0 sec                  | < 10.0 sec                     |
| <b>LOS B</b> <ul style="list-style-type: none"><li>➤ Stable flow</li><li>➤ Other vehicles in the traffic stream become noticeable</li><li>➤ Reduction in freedom to maneuver from LOS A</li></ul>   | 10.0 – 20.0 sec             | 10.0 – 15.0 sec                |
| <b>LOS C</b> <ul style="list-style-type: none"><li>➤ Stable flow</li><li>➤ Maneuverability and operating speed are significantly affected by other vehicles</li><li>➤ General level of comfort and convenience declines noticeably</li></ul>  | 20.0 – 35.0 sec             | 15.0 – 25.0 sec                |
| <b>LOS D</b> <ul style="list-style-type: none"><li>➤ High density but stable flow</li><li>➤ Speed/freedom to maneuver are very restricted</li><li>➤ General level of comfort / convenience is poor</li><li>➤ Small increases in traffic will generally cause operational problems</li></ul>   | 35.0 – 55.0 sec             | 25.0 – 35.0 sec                |
| <b>LOS E</b> <ul style="list-style-type: none"><li>➤ Unstable flow</li><li>➤ Speed reduced to lower but relatively uniform value</li><li>➤ Volumes at or near capacity level</li><li>➤ Comfort and convenience are extremely poor</li><li>➤ Small flow increases or minor traffic stream disturbances will cause breakdowns</li></ul> | 55.0 – 80.0 sec             | 35.0 – 50.0 sec                |
| <b>LOS F</b> <ul style="list-style-type: none"><li>➤ Forced or breakdown flow</li><li>➤ Volumes exceed roadway capacity</li><li>➤ Formation of unstable queues</li><li>➤ Stoppages for long periods of time because of traffic congestion</li></ul>   | > 80.0 sec                  | > 50.0 sec                     |

The results of this analysis are based on the procedures presented in the *HCM 2010* and performed with the corresponding capacity analysis software described previously. The methodology of evaluating each condition for signalized intersections is presented below:

- **Condition 1** – Use current Town of Chapel Hill data for the cycle length, splits and offsets of individual signalized intersections and report LOS and delay values from Synchro.
- **Conditions 2 and 3** – Reoptimize the cycle lengths and splits of individual intersections in Synchro, if existing timing data does not provide adequate overall intersection LOS. Adjust cycle lengths, splits, and offsets, if necessary, if the signal is currently operating in a coordinated

system. The optimized signal timing information will be held constant for both Conditions, to provide a means to compare effects of the proposed site traffic.

- **Conditions 4 and 5** – Optimize coordinated traffic signals for effects of recommended mitigation strategies that change existing/committed changes to lane geometrics. Evaluate the potential for different signal phasing schemes (left-turn lag phases, for example). Retain existing split minimums and any pedestrian timing values. Recommendations, if warranted, will be made to obtain at least LOS D for the intersection as a whole.

The net effect of this process is that direct comparisons, by movement, of delay and LOS between each of the three conditions are impossible because splits and cycle lengths can and do change between conditions. The pertinent statistic of this analysis is the *overall intersection level of service and delay*. Improvements to deficient intersections in Condition 3 were made by first attempting to adjust signal operations via changes in cycle lengths, splits and/or with acceptable adjustments to signal phasing. If that did not produce satisfactory results for all intersections, geometric improvements to improve intersection capacity were considered for the deficient intersections. **Appendix E** contains the Synchro output for all four conditions (where applicable).

The existing Bennett Road and proposed site driveway unsignalized intersections with Mt. Carmel Church Road were analyzed in Synchro using the HCM 2010 two-way stop control methodology and output function. Their results were evaluated on a per-movement basis, since the HCM computations do not produce an overall intersection level of service for unsignalized intersections. Thus, intersections with deficient (LOS F) movements in Condition 2 would need to be evaluated for improvements in Condition 3. This methodology differs from signalized intersections, where one or more movements at an intersection may be deficient in Condition 2, but if the overall intersection level of service does not fall below LOS D, no intersection improvements are deemed necessary. **Appendix F** contains the Synchro unsignalized intersection output for all unsignalized intersections under study. The proposed roundabout improvement operational results from the SIDRA software for all scenarios are found in **Appendix G**.

#### **ii.) 2017 Existing Conditions Results**

**Table 7** presents the results for the existing year traffic conditions as compiled from field data. The table lists LOS and delay values for those movements that are in existence at this time. It also only lists data for individual movements encountering delay at the stop-controlled intersection (which does not have an overall intersection delay value produced by HCS). Currently, all study area signalized intersections operate at acceptable levels of service for all the analyzed 2017 peak hours. The recent improvements to the Mt. Carmel Church leg of its intersection with US 15-501 (including signal phasing and timing changes) were included in this analysis.

Field observation verified that AM and PM peak hour congestion occurs along the US 15-501 corridor between the NC 54 Bypass interchange ramps and southward to the nearby Mt. Carmel Church Road/Culbreth Road intersection. In the AM peak, congestion along the NC 54 Bypass and interchange area spills back through the Mt. Carmel Church Road/Culbreth Road intersection.

Operations at the Mt. Carmel Church Road/Bennett Road intersection for stop-controlled movements are acceptable, based on Town of Chapel Hill LOS E thresholds for unsignalized intersection movements. Field observation noted that there are periods where there are few acceptable gaps for Bennett Road left-turning vehicles, leading to some occasional lengthy delays, though the number of vehicles attempting left-turns from Bennett Road in either direction is small during the peak hours. **Table 7** also presents a comparison for the proposed NCDOT roundabout

**Town of Chapel Hill: Traffic Impact Study**  
*Chapel Hill Cooperative Preschool - Proposed Institutional Development*

project at this location using current traffic volumes. Results show the roundabout should function well (LOS A or B for all approaches) during peak travel periods.

**Table 7. Capacity Analysis Results for Study Area Intersections**  
**Condition 1 – 2017 Existing Traffic**

| Intersections / Movements   | LOS      |      |          | Average Vehicular Delay<br>(seconds/vehicle) |      |             |

N/A => Not Applicable, i.e. movement is non-existent or overall intersection values are not reported for unsignalized intersections  
**BOLD/ITALICS** – Movement or overall intersection is over Town TIS Guidelines threshold capacity

### **iii.) 2019 No-Build Scenario (Condition 2) Results**

**Table 8** presents the results for the 2019 Build-out+1 analysis year estimated traffic conditions without the impacts of site-related traffic. This analysis includes the application of the 1.2 percent per year ambient growth factor and selected specific background development volumes to existing traffic volumes. A summary of operations is given after the tabular information.

N/A => Not Applicable, i.e. movement is non-existent or overall intersection values are not reported for unsignalized intersections

**BOLD/ITALICS** – Movement or overall intersection is over Town TIS Guidelines threshold capacity

During Condition 2 - 2019 Without Site Traffic, all study area intersections are expected to operate at acceptable levels of service for all analyzed peak hours, with marginal increases in overall and movement delays as ambient traffic growth is experienced over the next few years. For the Condition 2 analysis, existing 2017 signal timings and system operations were held constant for signal cycle lengths, splits, and offsets to provide a comparison with existing system efficiency.

#### iv.) 2019 Build Scenario (Condition 3) Results

**Table 9** presents results for 2019 Build-out+1 year estimated traffic conditions, including impacts of site-related traffic. In general, the addition of site-related traffic will marginally increase delays at the signalized interchange intersections, but not cause either to become deficient (overall LOS E or

**Town of Chapel Hill: Traffic Impact Study**  
Chapel Hill Cooperative Preschool - Proposed Institutional Development

F). As in Condition 2, signal timings were held constant from existing 2017 conditions. The impacts of the proposed site would be more pronounced at the Mt. Carmel Church Road and Bennett Road intersection if the roundabout project is not complete by 2019 when the site is fully operational. For the analysis in Table 9, site trips that would use the roundabout to make a u-turn back to enter the site were rerouted down to Bennett Road to make a left-turn onto Mt. Carmel Church Road. This causes potentially major delays and queue spillback for the eastbound Bennett Road approach, particularly in the AM Peak hour. Site driveway operations are acceptable, with minimal (less than two vehicles queued) in all 2019 peak hours analyzed.

N/A => Not Applicable, i.e. movement is non-existent or overall intersection values are not reported for unsignalized intersections

**BOLD/ITALICS** – Movement or overall intersection is over Town TIS Guidelines threshold capacity

#### v.) 2019 Mitigation Scenario (Condition 4) Results

Based on capacity analysis results in the previous sections, no intersection in the project study is expected to require mitigation for issues related strictly to projected vehicular delay and LOS. However, considerations to optimize traffic operations and reduce potential queuing along the US 15-501 corridor were studied to allow traffic operations and vehicular delays to be at least at 2019 without site scenario levels. Current signal timings (cycle lengths/splits/offsets) were reoptimized for this analysis, with no geometric changes implemented.

**Table 10** presents results for 2019 Build-out+1 year estimated traffic conditions, including impacts of site-related traffic and mitigation necessary to meet Town of Chapel Hill Guidelines and proposed recommendations from this study.

**Table 10. Capacity Analysis Results for Study Area Intersections  
Condition 4 – 2019 Traffic With Site & Mitigation**

| Intersections   | LOS      |      |          | Average Vehicular Delay<br>(seconds/vehicle) |      |             |

**BOLD/ITALICS** – Movement or overall intersection is over Town TIS Guidelines threshold capacity

As shown in **Table 10**, small changes to signal optimization to reflect changes in traffic patterns due to ambient background growth and impacts of additional site-related traffic are able to marginally improve overall intersection LOS and per vehicle delay to levels similar to the 2019 Without Site conditions.

#### vi.) 2022 Build Scenario (Condition 5) Results

**Table 11** presents results for 2022 Build-out+1 year estimated traffic conditions, including impacts of site-related traffic and the full build-out of the Obey Creek development. In general, the addition of Obey Creek traffic will increase delays at the signalized intersections along US 15-501, but not cause either to become deficient (overall LOS E or F). This analysis does not include additional corridor-wide recommendations from the Obey Creek Traffic Impact Study that were developed to further mitigate impacts from that development, as the study area for the Obey Creek development was much larger than the study area for this report. Additional geometric and signal operations improvements along the US 15-501 corridor recommended in the Obey Creek study would likely produce more beneficial results than what are listed in **Table 11**.

**Table 11. Capacity Analysis Results for Study Area Intersections  
Condition 5 – 2022 Traffic With Site & Obey Creek Full Build-Out**

| Intersections / Movements                                     | LOS      |      |          | Average Vehicular Delay (seconds/vehicle) |      |              |

N/A => Not Applicable, i.e. movement is non-existent or overall intersection values are not reported for unsignalized intersections  
**BOLD/ITALICS** – Movement or overall intersection is over Town TIS Guidelines threshold capacity

## B. Access Analysis

Vehicular site access is to be accommodated by a single restricted (RIRO) access driveway connecting to Mt. Carmel Church Road about 575 feet to the east of its signalized intersection with US 15-501. Design details related to driveway throat length are shown on the site plan and assume an approximate 50 foot driveway throat at this driveway, which is consistent with a required 50 foot throat depth in Figure 3.9 of the 2017 *Chapel Hill Public Works Engineering Design Manual*. An internal driveway circulation system to all surface parking areas and parent drop-off locations along the internal driveway traffic circle is also shown on the plans.

Driveway distances along Mt. Carmel Church Road from the signalized intersection at US 15-501 and the adjacent Old Bridge Road intersection are approximately 575 feet and 275 feet, respectively, and are acceptable, based on recommendations of 100 foot minimum corner clearance (between a driveway location and adjacent intersection) as set forth in the 2003 *NCDOT Policy on Street and Driveway Access to North Carolina Highways* and the 100 foot minimum along collector streets specified in the Town Design Manual. The proposed spacing between the proposed driveway and adjacent existing driveways (few existing in immediate vicinity of the project) is more than the recommended 50 foot spacing between driveway locations along collector roadways found in Table 3.2 in the Town Design Manual.

There are bike and pedestrian facilities in the project study area, though not specifically along Mt. Carmel Church Road to the proposed site. Sidewalk is present on the west side of US 15-501 and exists along the major street connection along Culbreth Road. Crosswalk and pedestrian signals exist in at least one quadrant of the signalized study area intersections near the Chapel Hill Cooperative Preschool site. Specific bicycle amenities are present along US 15-501 with striped lanes present in both directions. The Morgan Creek Greenway system and additional paved path linkages are present west of the US 15-501 corridor, along the creek and under the James Taylor Bridge.

## C. Signal Warrant Analysis

Based on projected 2019 and 2022 traffic volumes and current/proposed access plans, no unsignalized study area intersection would warrant the installation of a traffic signal, based on the methodology found in the 2009 *Manual on Uniform Traffic Control Devices (MUTCD)*. The unsignalized intersection of Mt. Carmel Church Road and Bennett Road was not analyzed for signal warrants, as the NCDOT U-5864 project proposed to construct a roundabout at this location.

## D. Sight Distance Analysis

In general, sight distance issues entering/exiting the existing Chapel Hill Cooperative Preschool driveway should be minimal, considering the fact that the driveway is proposed to be restricted to a RIRO configuration. The current site plan shows sight distance triangles at the driveway stopbar which should provide adequate sight distance provided that the area within the triangles be kept free of any sight obstructions. There is both horizontal and vertical curvature upstream of this location, but the driveway is located on the outside of the horizontal curve, which should aid in visibility of upstream approaching traffic.

## E. Crash Analysis

Project study area crash data from the NCDOT Traffic Safety Unit TEAAS database was extracted by HNTB for the five year period from 8/31/2012 to 9/1/2017. This information included crash segment data along Mt. Carmel Church Road between US 15-501 and Bennett Road and crash reports for the US 15-501/Mt. Carmel Church Road and Bennett Road/Mt. Carmel Church Road intersections adjacent

**Town of Chapel Hill: Traffic Impact Study**  
*Chapel Hill Cooperative Preschool - Proposed Institutional Development*

to the site. Raw intersection and corridor segment crash data is located in **Appendix H** and results are shown in **Tables 12 and 13** and summarized in **Figure 13** for the Mt. Carmel Church Road segment between US 15-501 and Bennett Road.

#### Mt. Carmel Church Road Corridor

**Table 12** presents a comparison between the Mt. Carmel Church Road corridor study area crash rates and the latest North Carolina statewide rates for the period 2013-2015 (compiled by NCDOT Traffic Safety Unit). These rates are for similar facilities, in terms of cross-section, relative location, and functional classification, across North Carolina. Overall, the crash rate along Mt. Carmel Church Road in the project study area was considerably higher than statewide averages for similar facilities for all crash characteristic categories. Rear-end crashes and angle crashes were the most common crash types – with 11 of each type representing approximately 50 percent of the 40 crashes reported along the 0.38 mile segment. Spatial distribution of crashes along the corridor varies, with 11 crashes on Mt. Carmel Church Road near Bennett Road, four near Lombard Drive, two near Mallard Drive, two near Old Bridge Road and 21 in the vicinity of US 15-501.

**Table 12. Study Area Crash Rate Comparison – Mt. Carmel Church Road Corridor**

| Statistic                     | Crashes Per 100 Million Vehicle Miles |   |  |
|-------------------------------|---------------------------------------|---|--|
|                               | Mt. Carmel Church Road                | NC Statewide Average                        |  |
|                               | US 15-501 to Bennett Road             | Urban Secondary Routes (Two-Lane Undivided) |  |
| Total Crash Rate              | 576.47                                | 247.39                                      |  |
| Fatal Crash Rate              | 0.00                                  | 1.18  |  |
| Non-Fatal (Injury) Crash Rate | 259.41                                | 76.16                                       |  |
| Wet Pavement Crash Rate       | 100.88                                | 46.04                                       |  |
| Night Crash Rate              | 100.88                                | 65.51                                       |  |

#### Study Area Intersections

In addition to the crash comparison for the Mt. Carmel Church Road project study corridor, individual intersection crash data in the vicinity of the proposed site for the same five year period was provided by NCDOT and results are shown in **Table 13**. The crash data reveals that the Mt. Carmel Church Road / Bennett Road intersection has a higher overall rate of crashes than the higher volume US 15-501 intersection with Mt. Carmel Church Road / Culbreth Road, but a lower rate of injury crashes. The primary crash type at both intersections was rear-end collisions. No pedestrian or bicycle crashes were reported at either intersection. The proposed roundabout at Mt. Carmel Church Road and Bennett Road should have a positive effect on crash rates at this location.

**Table 13. Study Area Intersection Crash Summary**

| Intersection   | Total Crashes (Injury) | Crashes Per 100 Million Vehicles Entered |       |        |       |      |
|--|------------------------|--|-------|--------|-------|------|
|  |                        | Total                                    | Fatal | Injury | Night | Wet  |
| US 15-501 and Mt. Carmel Church Road / Culbreth Road | 33 (17)                | 44.08                                    | 0.00  | 22.71  | 4.01  | 8.01 |
| Mt. Carmel Church Road and Bennett Road              | 15 (3)                 | 78.24                                    | 0.00  | 15.65  | 5.22  | 5.22 |

## F. Other Transportation-Related Analyses

Other transportation-related analyses relevant to the 2001 Town of Chapel Hill Guidelines for the preparation of Traffic Impact Studies were completed as appropriate. The topics listed in **Table 14** are germane to the scope of this study.

**Table 14. Other Transportation-Related Analyses**

| <b>Analysis</b>  | <b>Comment</b>   |
|--|--|
| Long-Range Planning Level Daily Volume-Capacity Analysis | Due to the fact that the proposed site will add less than 500 daily trips to the study area network, no long-range daily v/c analysis was conducted for this study.  |
| Turn Lane Storage Requirements                           | Storage bay lengths at study area intersections were analyzed using Synchro and HCS 95 <sup>th</sup> percentile (max) queue length estimates for the 2019 and 2022 Build Scenarios. The US 15-501 and Mt. Carmel Church Road / Culbreth Road intersection westbound approach has projected queues that near the capacity of its current redesigned storage bays that may need additional mitigation by retiming the signalized intersection to prevent excessive queue spillback that would block the proposed site driveway. No other recommendations for improvements to storage bays are expected, based on the analysis results.         |
| Appropriateness of Acceleration/Deceleration Lanes       | The site concept plan shows no specifics related to acceleration/deceleration lanes. Based on previous recommendations from NCDOT regarding this project, and considering the need to provide efficient operations in the vicinity of the site driveway intersection, a 100 foot deceleration taper for right-turns into the site is recommended. No other specific acceleration/deceleration lane issues were analyzed in the project study area.   |
| Pedestrian and Bicycle Analysis                          | Existing pedestrian and bicycle access and connectivity exists along the US 15-501 corridor adjacent to the site, but no amenities for pedestrians or bicycles exist along Mt. Carmel Church Road adjacent to the site. Sidewalk exists along the US 15-501 corridor and pedestrian crossings and signals are present on at least one quadrant of signalized intersections. Delineated bicycle lanes are present along the corridor in the project study area. The Morgan Creek Trail Greenway has access to existing roadway facilities and adjacent neighborhoods and may provide the best non-motorized connection for the proposed site. |
| Public Transportation Analysis                           | Public transportation service to the study area, and to the proposed site, is available with bus stops located along US 15-501 and Culbreth Road and local CHT bus routes serving the area. However, no direct access connections from the stops to the site currently exist, nor is there a northbound stop along US 15-501 near Mt. Carmel Church Road.  |

## G. Special Analysis/Issues Related to Project

Based on discussions with Town of Chapel Hill staff, a review of previously submitted materials by the Applicant, Town and NCDOT was made for this study to compare results/recommendations from those sets of information to the current traffic impact analysis.

In general, the NCDOT results and recommendations are consistent with data and results from this study with regards to trip generation values (at the current levels of the existing preschool facilities) and to operational results for study area intersections. One of the primary purposes of conducting a full

## Town of Chapel Hill: Traffic Impact Study

*Chapel Hill Cooperative Preschool - Proposed Institutional Development*

---

traffic impact study for the proposed preschool was to make an independent comprehensive analysis of all project details - trip generation information, the effects of the recent Town project to restripe the Mt. Carmel Church Road approach to US 15-501 and associated signal phasing upgrades, the comparison of operations at the Mt. Carmel Church Road/Bennett Road intersection between the proposed roundabout and existing traffic control and the ultimate effects on operations of the build-out traffic associated with the Obey Creek development. This report assesses all of these parameters and scenarios.

In addition, to better understand safety concerns raised by local residents about traffic operations and safety along Mt. Carmel Church Road in the vicinity of the proposed site location, a field analysis was completed on 10/17/17 to observe AM and PM peak hour queues at the Mt. Carmel Church Road intersection with US 15-501 after the Town project was complete and open to traffic for approximately one week. Traffic patterns were observed from 7:30 – 8:30 AM and from 5:00 – 6:00 PM, peak hour times that correspond to the highest reported traffic count data at the US 15-501/Mt. Carmel Church Road – Culbreth Road intersection. Maximum observed queues (number of vehicles in the outside right-turn lane in the new dual right-turn lane configuration) were collected in approximate two-minute increments – which corresponded to the traffic signal cycle length and dispersion of queue during each signal cycle. Observations were limited to the outer lane because it was noted that this lane was far more utilized than the inner lane. Results are as follows:

- AM Peak hour – average maximum queue length = 13 vehicles = 325 feet, worst case maximum queue length = 25 vehicles = 625 feet.
- PM Peak hour – average maximum queue length = 6 vehicles = 150 feet, worst case maximum queue length = 14 vehicles = 350 feet.

In the AM peak hour, queue observations noted that the worst-case queues would occasionally (2-3 times during the peak hour) reach the area of where the proposed preschool driveway would be located. The prime factor in these circumstances was the inability for right-turning traffic at the intersection to enter the intersection due to congestion on the NC 54 Bypass eastbound on-ramp and congestion northbound through the interchange area. When there was availability of gaps to move the Mt. Carmel Church Road eastbound right-turning traffic, queues quickly reduced. No issues were noted for queuing for the new shared left-turn/through traffic movement on Mt. Carmel Church Road.

## **IV. MITIGATION MEASURES/RECOMMENDATIONS**

### **A. Planned Improvements**

NCDOT STIP U-5864 proposes to construct a single-lane roundabout at the intersection of Mt. Carmel Church Road and Bennett Road, with construction occurring in 2018. To account for this improvement project, all 2019 and 2022 analysis conditions for this study include a scenario that assesses the operational performance of the proposed roundabout given its design parameters and anticipated traffic volumes.

There are no other Town of Chapel Hill or North Carolina Department of Transportation improvement projects for study area roadway facilities within the analysis year time frame of 2017-2022. NCDOT continues to study the US 15-501 corridor in and around Chapel Hill through feasibility studies and NCDOT Strategic Prioritization studies, but no committed projects are expected in the 2017-2022 timeframe. NCDOT has an identified STIP project (U-5304A) that may include improvements to the NC 54 Bypass interchange, and US 15-501 in the vicinity of the interchange, included as part of its design,

but no committed design exists at this time. U-5304A is currently slated for construction beginning in 2026.

## B. Background Committed Improvements

There are no specific geometric or operational improvements to study area roadway intersections or facilities related to background private development projects that are expected to be completed between 2017 and 2019. Additional changes and improvements to intersections along the US 15-501 corridor that were recommended/committed to as part of the Obey Creek Mixed-Use development are all located at intersections that are beyond the specific study area for the Chapel Hill Cooperative Preschool. One recommended improvement from the Obey Creek study, the pavement marking restriping on Mt. Carmel Church Road and signal design and timing upgrades at its intersection with US 15-501 have recently been completed.

## C. Applicant Committed Improvements

Based on the site concept plan and supporting development information provided, there are the following specific transportation-related improvements proposed adjacent to the Chapel Hill Cooperative Preschool:

- Construction of a concrete median along Mt. Carmel Church Road at the proposed site driveway to block ingress and egress of left-turning vehicles along with appropriate signage to prevent wrong-way maneuvers.
- Commitment to providing an easement along Mt. Carmel Church Road site frontage to connect to the Morgan Creek Greenway system.

## D. Necessary Improvements

Based on traffic capacity analyses for the 2019 build-out+1 year and 2022 future analysis year, and analyses of the proposed site plan and internal driveways/circulation, the following improvements are recommended as being necessary for adequate transportation network operations (see **Figure 14**).

- 1) Retime the traffic signals along the US 15-501 corridor from the NC 54 Bypass interchange through Arlen Park Drive / Bennett Road to offset the impacts of site-related traffic and ensure that queuing along Mt. Carmel Church Road can be contained as efficiently as possible within the existing 375 foot dual right-turn lane configuration.
- 2) To provide safe and efficient operations in the direct vicinity of the proposed site driveway along Mt. Carmel Church Road, a dedicated 100 foot right-turn taper (matching previous NCDOT recommendations) should be constructed along Mt. Carmel Church Road.

These recommendations assume the construction of the NCDOT STIP U-5864 roundabout at Mt. Carmel Church Road / Bennett Road occurs before the preschool is built-out. If the U-5864 project is delayed, it is recommended that the Applicant coordinate with school staff and parents to inform them that traffic needs to use the alternative route inbound of US 15-501 to Bennett Road to Mt. Carmel Church Road. Operational results for this scenario indicate that this alternative may lead to lengthy delays for site trips at the eastbound Bennett Road stop-controlled approach. Construction of the roundabout will eliminate these operational issues and should provide a quicker means of accessing the site.

## MSTA School Traffic Calculations

AM and PM Peak Traffic Estimates

(These numbers do not reflect peak hour traffic volumes)

| AM Cars / Student | PM Cars / Student | Avg. Car Length | PM At one Time |
|-------------------|-------------------|-----------------|----------------|
| 36.56%            | 16.31%            | 22.19           | 45.50%         |
| 34.58%            | 14.10%            | 22.70           | 51.90%         |
| 9.20%             | 4.30%             | 24.42           | 55.71%         |

|          |        |       |        |
|----------|--------|-------|--------|
| P 43.35% | 26.30% | 22.00 | 37.87% |
|----------|--------|-------|--------|

Private & Charter school data is based on few to no buses and uses the same percentages for all school types (elementary, middle, & high).

**NOTES**

- Average Queue Length does not include an alternative traffic pattern required for high traffic demand days.
- Average Queue Length does not include the Student Loading Zone.
- Peak traffic volumes at schools normally occur within a 30-minute time period. (justifying a PHF of 0.5)

School Name: Chapel Hill Cooperative Preschool  
Is this a Typical PUBLIC school?  No

Version: 111015

### MSTA School Queue Input

| Type School | Student Population | Number of Buses | Staff Members | Student Drivers | PM Total Vehicles | PM Peak Vehicles | Average Queue Length | Total AM Trips | Total PM Trips | High Demand Length |
|-------------|--------------------|-----------------|---------------|-----------------|-------------------|------------------|----------------------|----------------|----------------|--------------------|
| Private E   | 100                |                 | 22            |                 | 27                | 10               | 225                  | 109            | 54             | 30%                |
|             |                    | 1               | 13            |                 |                   |                  |                      |                |                |                    |

### NOTES

- Average Queue Length does not include an alternative traffic pattern required for high traffic demand days.
- Average Queue Length may include the Student Loading Zone.
- Peak traffic volumes at schools normally occur within a 30-minute time period. (justifying a PHF of 0.5)

### **Narrative Describing Proposed Chapel Hill Cooperative Preschool**

The Chapel Hill Cooperative Preschool was originally organized in 1960 by the Community Church in Chapel Hill as a parent cooperative and the first integrated preschool in the area. The Preschool is a non-profit childcare center governed by a board of directors, including parents and community representative(s). The preschool first extended its enrollment to the full year in 1972. The two (2) year old and Infant/Toddler programs were started in 1980 and 1997 respectively.

Currently there are two (2) school locations. Both Sites are state licensed through the Division of Child Development and accredited by the National Association for the Education of Young Children. The Preschool site is located at the Community Church (106 Purefoy Road, Chapel Hill) and the Infant/Toddler site is located at the Church of Reconciliation (110 N. Elliott Road, Chapel Hill). These two facilities contain a maximum of eighty (80) children and twenty (20) teachers (including the Executive Director). These existing facilities will be combined at the proposed Mt. Carmel Church Road site.

The Chapel Hill Cooperative Preschool is proposing to construct an 8,929-sf one-story building with an adjacent playground, a 23-space off-street parking area and associated site improvements.

The hours of operation for the school is 7:30-5:30. Families begin dropping off students between 7:30am and 9:00am and pick up times is between 12:00-5:30. There are several enrollment options for families to choose; consequently, it is not unusual to have fewer than 80 students and 20 staff on-site. Enrollment options (i.e.: duration of day) for the children are: half day (7:30-12:00),  $\frac{3}{4}$  day (7:30-3:00), and full day (7:30-5:30). Additionally, students can be enrolled on a full-time (5 days a week) or on a part-time basis (2 to 3 days per week). Staff have staggered work schedules; there are morning and afternoon shift teachers. The staggering of staff and children will minimize the traffic impact to the surrounding area. This as well as site access will be discussed in more detail in the Traffic section of this narrative.

CHCP offer a breakfast snack, lunch and afternoon snack to the children. Food preparation on-site is limited; most food is brought to the site prepared and only requires warming and portioning for the students.

The Chapel Hill Cooperative Preschool and the design team have thoroughly reviewed the site and the present/future needs for the school. The application being presented has been designed to utilize the character of this site while minimize the impact (to the site) and the surrounding area. A few examples of this are as follows:

- Existing on-site structures such as the “Sugar Shack” and the dwelling are being re-used. The “Sugar Shack” will be utilized by the staff/children for activities and learning opportunities within the woods.
- The existing dwelling will be used during construction as a construction office for the contractor(s). This has been reviewed with the Chapel Hill Inspections Department and found to be acceptable as a temporary use. Once the proposed preschool building has sufficiently progressed, the construction office will be relocated into the new building and the dwelling will be vacated. The dwelling will then be demolished to the existing foundation prior to obtaining a certificate of occupancy for the new preschool building.
- An effort was made to maintain as many existing trees as possible and to integrate them into the design of the site. Specifically, the 20” double Hemlock tree at the center of the site was the major factor for the placement of the proposed building and parking area. This CHCP wants to utilize this tree and the immediate area around it as another learning opportunity which is unique to this site.
- Land disturbance was minimized and kept below 40,000 sf.

## **Traffic**

During the TRT meeting (including the comments issued by the TRT) the following topics were identified as concerns:

- Trip generation,
- The arrive/departure times of staff/students, and
- The concern of cars potentially queuing onto Mt. Carmel Church road if students are dropped off at a car loading zone within the driveway circle on-site

Based upon the comments received and discussions held during the TRT meeting, traffic counts were performed at both CHCP sites on Monday October 3, 2016, Tuesday October 4, 2016 & Wednesday October 5, 2016. The results of these counts have been attached to this narrative. These results indicate the following:

- On average, the majority of students arrive on-site between 8:00 and 9:10 with the peak occurring between 8:40 am to 9:00 am.
- Staff starts arriving on site around 7:00 am and is staggered throughout the morning.
- Approximately 40% of the students and approximately half of the staff (8-10) leave the site for the day by 4 pm.
- Based upon these counts, traffic generation is distributed throughout the day; this will minimize traffic impacts to the surrounding area/neighborhoods.
- To eliminate the concern of cars potentially queuing onto Mt. Carmel Church Road, the CHCP will have all parents park their cars on-site and walk the children into the building. To accommodate this volume of cars, the parking lot has been expanded to 23 spaces (including four (4) compact spaces). Operationally, the CHCP staff will occupy the westerly most spaces, this will also include temporary stacking of staff vehicles within the westerly end drive aisle during the peak morning time. The operational moving of staff vehicles is similar to how the current sites operate. This approach is being used to minimize the impervious area on-site.

- Proposed access to the site will be restricted to right turns into the site and right turns out of the site. This will be accomplished using a raised brick median within Mt. Carmel Church Road. CHCP staff and families will be instructed to access the site via Bennett Road and not utilize the surrounding residential street such as Old Bridge Lane for any of their traffic movements (i.e.: U-turns). CHCP will work with families/neighborhood to enforce this policy.

Deliveries to the site are infrequent. Refuse collection will be coordinated with the private collection company (or town) to minimize traffic impacts to the surrounding area.

In conjunction with the development of this site, the CHCP is committed to working with the NCDOT and Town during the Mobility Plan update. This will include the institution of a Transportation Management Plan; said plan will encourage the staff/parents to carpool, possible use of an off-site parking areas for staff with shuttle service to/from the site and to use the walking/biking infrastructure in the area (once constructed) to the maximum extent practicable. As previously indicated, the parents will be instructed to utilize the Bennett Road roundabout (once constructed) to not impact the adjacent residential neighborhoods.

### **Solid Waste**

Due to the uniqueness of the site and how the CHCP is attempting to minimizing the impact of the development on the site; consequently, alternative methods of recycling/trash pick-up are being proposed. CHCP will be requesting a waiver from Orange County picking up the site recyclables; this will be accomplished by use of a private company or families taking the recyclables off-site to an Orange County facility. Regarding trash pickup, the CHCP is proposing to compost on-site to reduce the volume generated by the school; a preliminary composting plan has been prepared by the CHCP and has been attached to this narrative. The remaining trash from the site will need to be picked up. The CHCP would request to discuss the possibility with the Town of an alternative trash collection vehicle serving this site; if this is not possible then the CHCP will contract this service with a private collector.

Amended November 18, 2016

**TRAFFIC**

## TOTAL TRIP GENERATION

| TIME        | Monday - 10/3/16 | Tuesday - 10/4/16 | Wednesday - 10/5/16 | AVERAGE TRIPS |

## **SOLID WASTE**

## **Compost Proposal Plan for the Chapel Hill Cooperative Preschool**

The Preschool is a cooperative preschool that requires families to volunteer 6 hours to the program completing daily, weekly, and monthly pragmatic duties. The Composting job would be a parent job that would fulfill the monthly participation requirement.

CHCP is looking at the benefits composting has:

- The amount of trash our school produces are reduced.
- Nutrients are recycled back into the soil.
- Soil erosion is prevented when you add compost.
- Awareness is created around recycling and waste reduction efforts with the kids, staff and families.

### ***Some of the steps we would go through to begin the process of starting a composting plan at CHCP:***

1. We would share our ideas and seek out others who may be supportive. We would include food service staff, teachers, parents, a knowledgeable compost staff through Orange County. We would start by having a forum to discuss how composting can be done at our school.
2. Recruit parents/teachers to develop the idea to form a Composting Committee. Members can come from, administration, kitchen staff, teachers, parents. The committee would be responsible for developing a clear plan of action, promoting the program, coordinating the actual work, and evaluating what's working and what's not.
3. Research what is involved in a school-wide composting operation. This is to determine the system that will work best for our school. Some things to think about is if the school will compost on or off site.
4. Define the scope of the project, plan the scope of the composting program our school is envisioning. Some ideas are to maybe start with a small pilot program or develop the program in phases.
5. Planning the details for the plan on composting in our program. For example, placing a table next to where kids compost, recycle and throw things away. Having signage to help kids visually see what waste items they are separating.  
Another method would be cutting a table to fit three buckets for these three options.

## Intersection Summary

Area Type: Other

Cycle Length: 130

Actuated Cycle Length: 130

Offset: 98 (75%), Referenced to phase 2:NETL and 6:SWTL, Start of Green

Natural Cycle: 90

Control Type: Actuated-Coordinated

Maximum v/c Ratio: 0.96

Intersection Signal Delay: 41.8

Intersection LOS: D

Intersection Capacity Utilization 80.1%

ICU Level of Service D

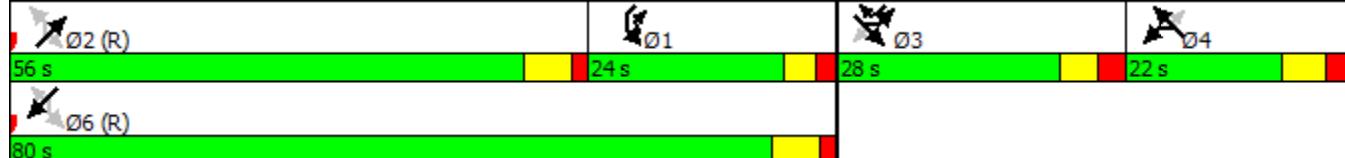

Analysis Period (min) 15

# 95th percentile volume exceeds capacity, queue may be longer.

Queue shown is maximum after two cycles.

m Volume for 95th percentile queue is metered by upstream signal.

Splits and Phases: 1: US 15-501 &amp; Mt. Carmel Church Road/Culbreth Road

## Intersection Summary

Area Type: Other

Cycle Length: 130

Actuated Cycle Length: 130

Offset: 71 (55%), Referenced to phase 2:NBT and 6:SBT, Start of Green

Natural Cycle: 90

Control Type: Actuated-Coordinated

Maximum v/c Ratio: 0.61

Intersection Signal Delay: 16.7

Intersection LOS: B

Intersection Capacity Utilization 54.1%

ICU Level of Service A

Analysis Period (min) 15

m Volume for 95th percentile queue is metered by upstream signal.

Splits and Phases: 3: US 15-501 &amp; Arlen Park Drive/Bennett Road

## Lanes, Volumes, Timings

## 1: US 15-501 &amp; Mt. Carmel Church Road/Culbreth Road

## Intersection Summary

Area Type: Other

Cycle Length: 80

Actuated Cycle Length: 80

Offset: 11 (14%), Referenced to phase 2:NETL and 6:SWTL, Start of Green

Natural Cycle: 60

Control Type: Actuated-Coordinated

Maximum v/c Ratio: 0.52

Intersection Signal Delay: 17.6

Intersection LOS: B

Intersection Capacity Utilization 58.7%

ICU Level of Service B

Analysis Period (min) 15

# 95th percentile volume exceeds capacity, queue may be longer.

Queue shown is maximum after two cycles.

m Volume for 95th percentile queue is metered by upstream signal.

Splits and Phases: 1: US 15-501 &amp; Mt. Carmel Church Road/Culbreth Road

## Lanes, Volumes, Timings

3: US 15-501 &amp; Arlen Park Drive/Bennett Road

## Intersection Summary

Area Type: Other

Cycle Length: 80

Actuated Cycle Length: 80

Offset: 18 (23%), Referenced to phase 2:NBT and 6:SBTL, Start of Green

Natural Cycle: 80

Control Type: Actuated-Coordinated

Maximum v/c Ratio: 0.39

Intersection Signal Delay: 8.4

Intersection LOS: A

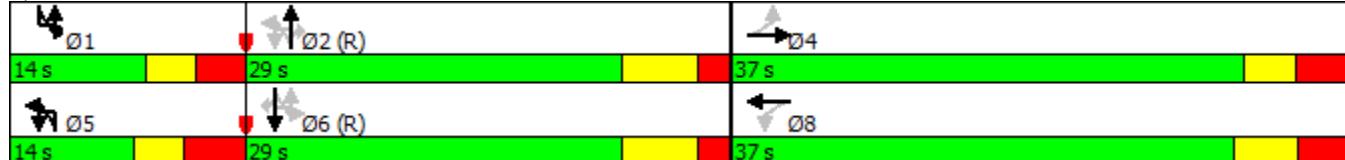

Intersection Capacity Utilization 40.8%

ICU Level of Service A

Analysis Period (min) 15

m Volume for 95th percentile queue is metered by upstream signal.

Splits and Phases: 3: US 15-501 &amp; Arlen Park Drive/Bennett Road

## Intersection Summary

Area Type: Other

Cycle Length: 140

Actuated Cycle Length: 140

Offset: 65 (46%), Referenced to phase 2:NETL and 6:SWTL, Start of Green

Natural Cycle: 90

Control Type: Actuated-Coordinated

Maximum v/c Ratio: 0.93

Intersection Signal Delay: 31.8

Intersection LOS: C

Intersection Capacity Utilization 78.6%

ICU Level of Service D

Analysis Period (min) 15

# 95th percentile volume exceeds capacity, queue may be longer.

Queue shown is maximum after two cycles.

Splits and Phases: 1: US 15-501 &amp; Mt. Carmel Church Road/Culbreth Road

## Lanes, Volumes, Timings

3: US 15-501 &amp; Arlen Park Drive/Bennett Road

## Intersection Summary

Area Type: Other

Cycle Length: 140

Actuated Cycle Length: 140

Offset: 114 (81%), Referenced to phase 2:NBTL and 6:SBTL, Start of Green

Natural Cycle: 90

Control Type: Actuated-Coordinated

Maximum v/c Ratio: 0.59

Intersection Signal Delay: 8.5

Intersection LOS: A

Intersection Capacity Utilization 55.7%

ICU Level of Service B

Analysis Period (min) 15

m Volume for 95th percentile queue is metered by upstream signal.

Splits and Phases: 3: US 15-501 &amp; Arlen Park Drive/Bennett Road

## Intersection Summary

Area Type: Other

Cycle Length: 130

Actuated Cycle Length: 130

Offset: 98 (75%), Referenced to phase 2:NETL and 6:SWTL, Start of Green

Natural Cycle: 90

Control Type: Actuated-Coordinated

Maximum v/c Ratio: 0.99

Intersection Signal Delay: 43.6

Intersection LOS: D

Intersection Capacity Utilization 81.5%

ICU Level of Service D

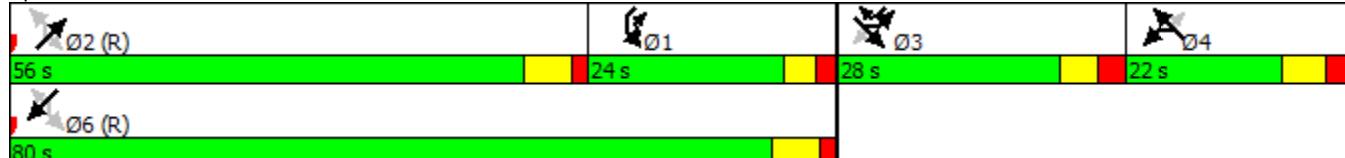

Analysis Period (min) 15

# 95th percentile volume exceeds capacity, queue may be longer.

Queue shown is maximum after two cycles.

m Volume for 95th percentile queue is metered by upstream signal.

Splits and Phases: 1: US 15-501 &amp; Mt. Carmel Church Road/Culbreth Road

## Intersection Summary

Area Type: Other

Cycle Length: 130

Actuated Cycle Length: 130

Offset: 71 (55%), Referenced to phase 2:NBT and 6:SBTL, Start of Green

Natural Cycle: 90

Control Type: Actuated-Coordinated

Maximum v/c Ratio: 0.62

Intersection Signal Delay: 17.0

Intersection LOS: B

Intersection Capacity Utilization 55.0%

ICU Level of Service B

Analysis Period (min) 15

m Volume for 95th percentile queue is metered by upstream signal.

Splits and Phases: 3: US 15-501 &amp; Arlen Park Drive/Bennett Road

## Lanes, Volumes, Timings

## Intersection Summary

Area Type: Other

Cycle Length: 80

Actuated Cycle Length: 80

Offset: 11 (14%), Referenced to phase 2:NETL and 6:SWTL, Start of Green

Natural Cycle: 60

Control Type: Actuated-Coordinated

Maximum v/c Ratio: 0.55

Intersection Signal Delay: 17.1

Intersection LOS: B

Intersection Capacity Utilization 59.6%

ICU Level of Service B

Analysis Period (min) 15

# 95th percentile volume exceeds capacity, queue may be longer.

Queue shown is maximum after two cycles.

m Volume for 95th percentile queue is metered by upstream signal.

Splits and Phases: 1: US 15-501 &amp; Mt. Carmel Church Road/Culbreth Road

## Lanes, Volumes, Timings

3: US 15-501 &amp; Arlen Park Drive/Bennett Road

## Intersection Summary

Area Type: Other

Cycle Length: 80

Actuated Cycle Length: 80

Offset: 18 (23%), Referenced to phase 2:NBT and 6:SBTL, Start of Green

Natural Cycle: 80

Control Type: Actuated-Coordinated

Maximum v/c Ratio: 0.40

Intersection Signal Delay: 8.5

Intersection LOS: A

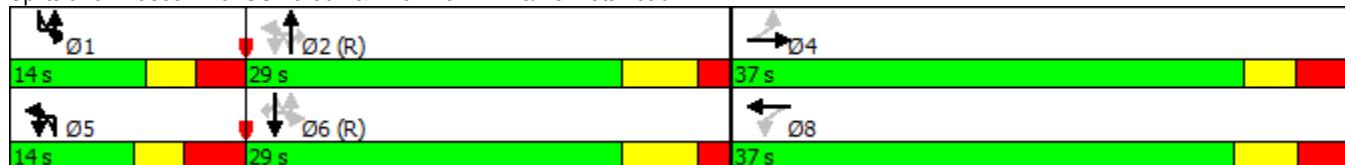

Intersection Capacity Utilization 41.4%

ICU Level of Service A

Analysis Period (min) 15

m Volume for 95th percentile queue is metered by upstream signal.

Splits and Phases: 3: US 15-501 &amp; Arlen Park Drive/Bennett Road

## Intersection Summary

Area Type: Other

Cycle Length: 140

Actuated Cycle Length: 140

Offset: 100 (71%), Referenced to phase 2:NETL and 6:SWTL, Start of Green

Natural Cycle: 90

Control Type: Actuated-Coordinated

Maximum v/c Ratio: 0.97

Intersection Signal Delay: 33.2

Intersection LOS: C

Intersection Capacity Utilization 80.0%

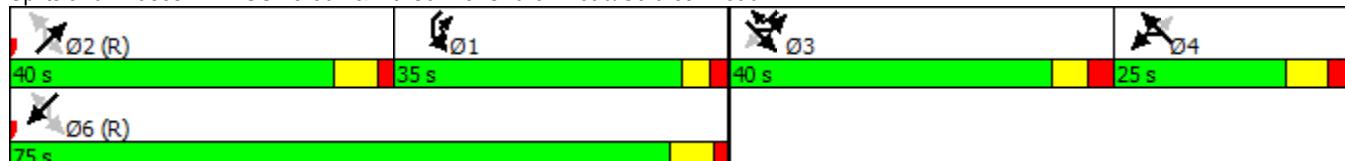

ICU Level of Service D

Analysis Period (min) 15

# 95th percentile volume exceeds capacity, queue may be longer.

Queue shown is maximum after two cycles.

Splits and Phases: 1: US 15-501 & Mt. Carmel Church Road/Culbreth Road

## Lanes, Volumes, Timings

3: US 15-501 &amp; Arlen Park Drive/Bennett Road

## Intersection Summary

Area Type: Other

Cycle Length: 140

Actuated Cycle Length: 140

Offset: 114 (81%), Referenced to phase 2:NBTL and 6:SBTL, Start of Green

Natural Cycle: 90

Control Type: Actuated-Coordinated

Maximum v/c Ratio: 0.59

Intersection Signal Delay: 10.1

Intersection LOS: B

Intersection Capacity Utilization 56.6%

ICU Level of Service B

Analysis Period (min) 15

m Volume for 95th percentile queue is metered by upstream signal.

Splits and Phases: 3: US 15-501 &amp; Arlen Park Drive/Bennett Road

## Intersection Summary

Area Type: Other

Cycle Length: 130

Actuated Cycle Length: 130

Offset: 98 (75%), Referenced to phase 2:NETL and 6:SWTL, Start of Green

Natural Cycle: 90

Control Type: Actuated-Coordinated

Maximum v/c Ratio: 1.05

Intersection Signal Delay: 46.9

Intersection LOS: D

Intersection Capacity Utilization 83.0%

ICU Level of Service E

Analysis Period (min) 15

~ Volume exceeds capacity, queue is theoretically infinite.

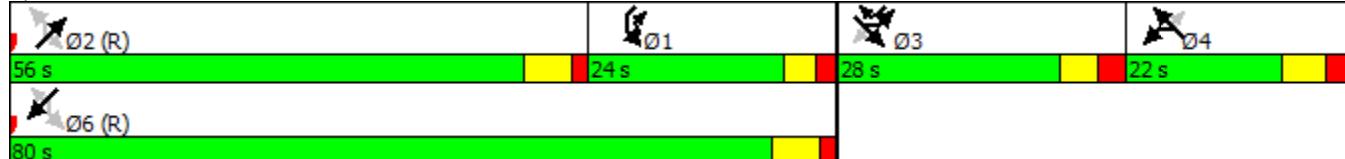

Queue shown is maximum after two cycles.

# 95th percentile volume exceeds capacity, queue may be longer.

Queue shown is maximum after two cycles.

m Volume for 95th percentile queue is metered by upstream signal.

Splits and Phases: 1: US 15-501 &amp; Mt. Carmel Church Road/Culbreth Road

## Intersection Summary

Area Type: Other

Cycle Length: 130

Actuated Cycle Length: 130

Offset: 71 (55%), Referenced to phase 2:NBT and 6:SBT, Start of Green

Natural Cycle: 90

Control Type: Actuated-Coordinated

Maximum v/c Ratio: 0.62

Intersection Signal Delay: 17.0

Intersection LOS: B

Intersection Capacity Utilization 55.1%

ICU Level of Service B

Analysis Period (min) 15

m Volume for 95th percentile queue is metered by upstream signal.

Splits and Phases: 3: US 15-501 &amp; Arlen Park Drive/Bennett Road

## Lanes, Volumes, Timings

## 1: US 15-501 &amp; Mt. Carmel Church Road/Culbreth Road

## Intersection Summary

Area Type: Other

Cycle Length: 80

Actuated Cycle Length: 80

Offset: 11 (14%), Referenced to phase 2:NETL and 6:SWTL, Start of Green

Natural Cycle: 60

Control Type: Actuated-Coordinated

Maximum v/c Ratio: 0.55

Intersection Signal Delay: 17.2

Intersection LOS: B

Intersection Capacity Utilization 59.9%

ICU Level of Service B

Analysis Period (min) 15

# 95th percentile volume exceeds capacity, queue may be longer.

Queue shown is maximum after two cycles.

m Volume for 95th percentile queue is metered by upstream signal.

Splits and Phases: 1: US 15-501 &amp; Mt. Carmel Church Road/Culbreth Road

## Intersection Summary

Area Type: Other

Cycle Length: 80

Actuated Cycle Length: 80

Offset: 18 (23%), Referenced to phase 2:NBT and 6:SBTL, Start of Green

Natural Cycle: 80

Control Type: Actuated-Coordinated

Maximum v/c Ratio: 0.40

Intersection Signal Delay: 8.6

Intersection LOS: A

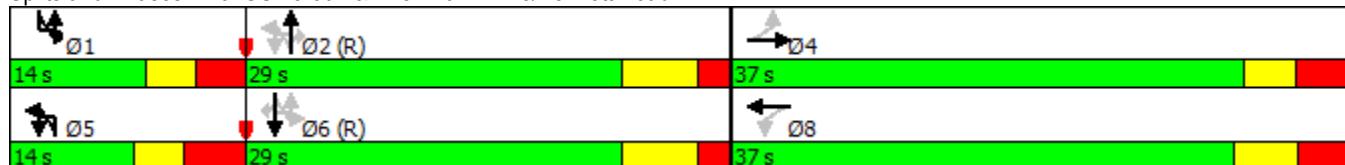

Intersection Capacity Utilization 41.5%

ICU Level of Service A

Analysis Period (min) 15

m Volume for 95th percentile queue is metered by upstream signal.

Splits and Phases: 3: US 15-501 & Arlen Park Drive/Bennett Road

## Intersection Summary

Area Type: Other

Cycle Length: 140

Actuated Cycle Length: 140

Offset: 100 (71%), Referenced to phase 2:NETL and 6:SWTL, Start of Green

Natural Cycle: 90

Control Type: Actuated-Coordinated

Maximum v/c Ratio: 1.05

Intersection Signal Delay: 37.4

Intersection LOS: D

Intersection Capacity Utilization 81.4%

ICU Level of Service D

Analysis Period (min) 15

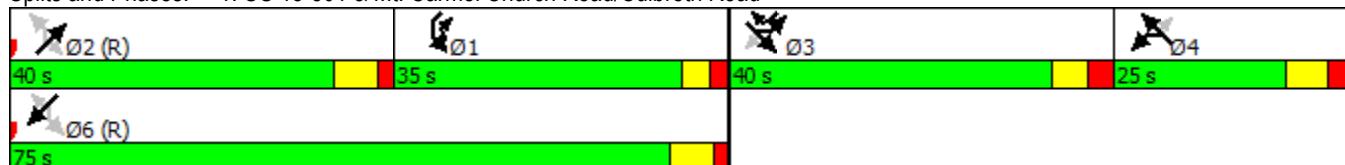

~ Volume exceeds capacity, queue is theoretically infinite.

Queue shown is maximum after two cycles.

# 95th percentile volume exceeds capacity, queue may be longer.

Queue shown is maximum after two cycles.

Splits and Phases: 1: US 15-501 &amp; Mt. Carmel Church Road/Culbreth Road

Lanes, Volumes, Timings  
3: US 15-501 & Arlen Park Drive/Bennett Road

## Intersection Summary

Area Type: Other

Cycle Length: 140

Actuated Cycle Length: 140

Offset: 114 (81%), Referenced to phase 2:NBTL and 6:SBTL, Start of Green

Natural Cycle: 90

Control Type: Actuated-Coordinated

Maximum v/c Ratio: 0.59

Intersection Signal Delay: 10.2

Intersection LOS: B

Intersection Capacity Utilization 56.8%

ICU Level of Service B

Analysis Period (min) 15

m Volume for 95th percentile queue is metered by upstream signal.

Splits and Phases: 3: US 15-501 &amp; Arlen Park Drive/Bennett Road

## Intersection Summary

Area Type: Other

Cycle Length: 130

Actuated Cycle Length: 130

Offset: 91 (70%), Referenced to phase 2:NETL and 6:SWTL, Start of Green

Natural Cycle: 90

Control Type: Actuated-Coordinated

Maximum v/c Ratio: 0.99

Intersection Signal Delay: 43.7

Intersection LOS: D

Intersection Capacity Utilization 83.0%

ICU Level of Service E

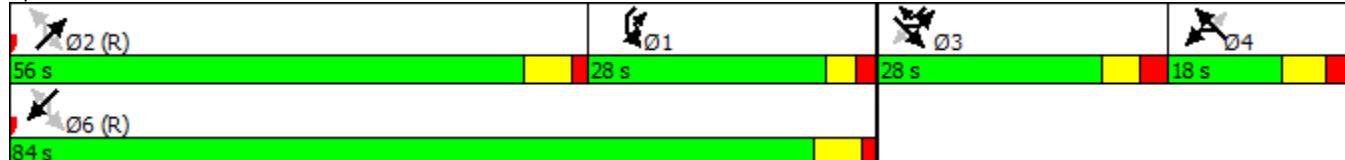

Analysis Period (min) 15

# 95th percentile volume exceeds capacity, queue may be longer.

Queue shown is maximum after two cycles.

m Volume for 95th percentile queue is metered by upstream signal.

Splits and Phases: 1: US 15-501 &amp; Mt. Carmel Church Road/Culbreth Road

## Intersection Summary

Area Type: Other

Cycle Length: 130

Actuated Cycle Length: 130

Offset: 84 (65%), Referenced to phase 2:NBT and 6:SBT, Start of Green

Natural Cycle: 90

Control Type: Actuated-Coordinated

Maximum v/c Ratio: 0.62

Intersection Signal Delay: 14.5

Intersection LOS: B

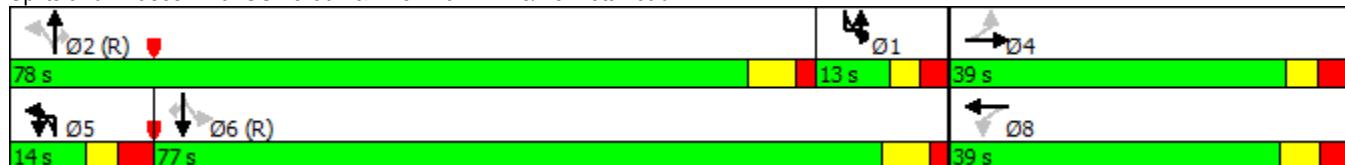

Intersection Capacity Utilization 55.1%

ICU Level of Service B

Analysis Period (min) 15

m Volume for 95th percentile queue is metered by upstream signal.

Splits and Phases: 3: US 15-501 &amp; Arlen Park Drive/Bennett Road

## Intersection Summary

Area Type: Other

Cycle Length: 90

Actuated Cycle Length: 90

Offset: 32 (36%), Referenced to phase 2:NETL and 6:SWTL, Start of Green

Natural Cycle: 60

Control Type: Actuated-Coordinated

Maximum v/c Ratio: 0.53

Intersection Signal Delay: 15.9

Intersection LOS: B

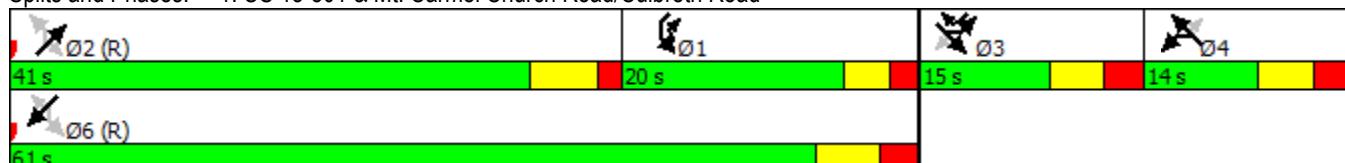

Intersection Capacity Utilization 59.9%

ICU Level of Service B

Analysis Period (min) 15

m Volume for 95th percentile queue is metered by upstream signal.

Splits and Phases: 1: US 15-501 &amp; Mt. Carmel Church Road/Culbreth Road

## Lanes, Volumes, Timings

3: US 15-501 &amp; Arlen Park Drive/Bennett Road

## Intersection Summary

Area Type: Other

Cycle Length: 140

Actuated Cycle Length: 140

Offset: 108 (77%), Referenced to phase 2:NBTL and 6:SBTL, Start of Green

Natural Cycle: 90

Control Type: Actuated-Coordinated

Maximum v/c Ratio: 0.59

Intersection Signal Delay: 9.1

Intersection LOS: A

Intersection Capacity Utilization 56.8%

ICU Level of Service B

Analysis Period (min) 15

m Volume for 95th percentile queue is metered by upstream signal.

Splits and Phases: 3: US 15-501 &amp; Arlen Park Drive/Bennett Road

## Intersection Summary

Area Type: Other

Cycle Length: 150

Actuated Cycle Length: 150

Offset: 144 (96%), Referenced to phase 2:NETL and 6:SWTL, Start of Green

Natural Cycle: 150

Control Type: Actuated-Coordinated

Maximum v/c Ratio: 1.13

Intersection Signal Delay: 54.1

Intersection LOS: D

Intersection Capacity Utilization 91.9%

ICU Level of Service F

Analysis Period (min) 15

~ Volume exceeds capacity, queue is theoretically infinite.

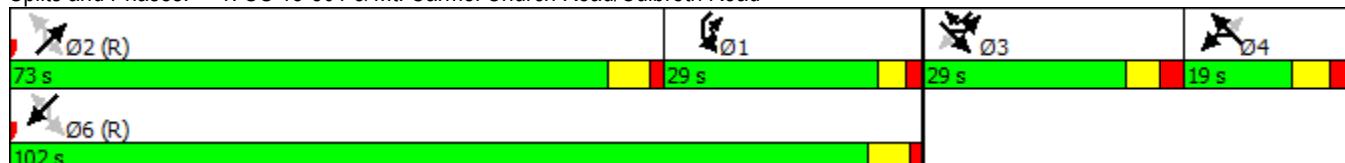

Queue shown is maximum after two cycles.

# 95th percentile volume exceeds capacity, queue may be longer.

Queue shown is maximum after two cycles.

m Volume for 95th percentile queue is metered by upstream signal.

Splits and Phases: 1: US 15-501 &amp; Mt. Carmel Church Road/Culbreth Road

## Lanes, Volumes, Timings

3: US 15-501 &amp; Arlen Park Drive/Bennett Road

## Intersection Summary

Area Type: Other

Cycle Length: 150

Actuated Cycle Length: 150

Offset: 136 (91%), Referenced to phase 2:NBTL and 6:SBTL, Start of Green

Natural Cycle: 100

Control Type: Actuated-Coordinated

Maximum v/c Ratio: 0.73

Intersection Signal Delay: 18.2

Intersection LOS: B

Intersection Capacity Utilization 65.2%

ICU Level of Service C

Analysis Period (min) 15

m Volume for 95th percentile queue is metered by upstream signal.

Splits and Phases: 3: US 15-501 &amp; Arlen Park Drive/Bennett Road

## Lanes, Volumes, Timings

## 1: US 15-501 &amp; Mt. Carmel Church Road/Culbreth Road

## Intersection Summary

Area Type: Other

Cycle Length: 90

Actuated Cycle Length: 90

Offset: 32 (36%), Referenced to phase 2:NETL and 6:SWTL, Start of Green

Natural Cycle: 80

Control Type: Actuated-Coordinated

Maximum v/c Ratio: 0.75

Intersection Signal Delay: 18.7

Intersection LOS: B

Intersection Capacity Utilization 70.9%

ICU Level of Service C

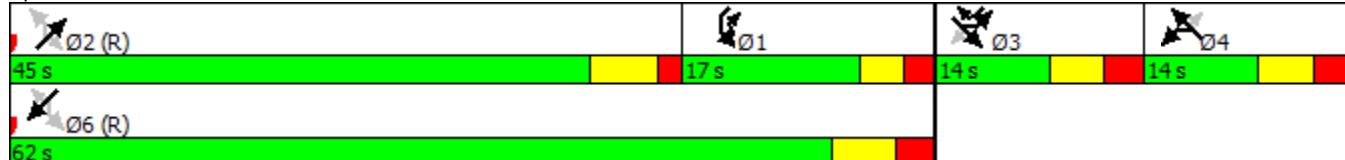

Analysis Period (min) 15

# 95th percentile volume exceeds capacity, queue may be longer.

Queue shown is maximum after two cycles.

m Volume for 95th percentile queue is metered by upstream signal.

Splits and Phases: 1: US 15-501 &amp; Mt. Carmel Church Road/Culbreth Road

## Lanes, Volumes, Timings

3: US 15-501 &amp; Arlen Park Drive/Bennett Road

## Intersection Summary

Area Type: Other

Cycle Length: 90

Actuated Cycle Length: 90

Offset: 8 (9%), Referenced to phase 2:NBT and 6:SBTL, Start of Green

Natural Cycle: 90

Control Type: Actuated-Coordinated

Maximum v/c Ratio: 0.53

Intersection Signal Delay: 7.6

Intersection LOS: A

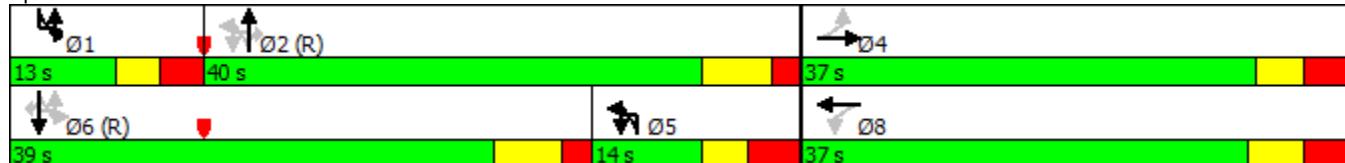

Intersection Capacity Utilization 53.3%

ICU Level of Service A

Analysis Period (min) 15

m Volume for 95th percentile queue is metered by upstream signal.

Splits and Phases: 3: US 15-501 &amp; Arlen Park Drive/Bennett Road

## Intersection Summary

Area Type: Other

Cycle Length: 150

Actuated Cycle Length: 150

Offset: 11 (7%), Referenced to phase 2:NETL and 6:SWTL, Start of Green

Natural Cycle: 140

Control Type: Actuated-Coordinated

Maximum v/c Ratio: 1.10

Intersection Signal Delay: 45.7

Intersection LOS: D

Intersection Capacity Utilization 98.8%

ICU Level of Service F

Analysis Period (min) 15

~ Volume exceeds capacity, queue is theoretically infinite.

Queue shown is maximum after two cycles.

# 95th percentile volume exceeds capacity, queue may be longer.

Queue shown is maximum after two cycles.

m Volume for 95th percentile queue is metered by upstream signal.

Splits and Phases: 1: US 15-501 &amp; Mt. Carmel Church Road/Culbreth Road

## Lanes, Volumes, Timings

3: US 15-501 &amp; Arlen Park Drive/Bennett Road

## Intersection Summary

Area Type: Other

Cycle Length: 150

Actuated Cycle Length: 150

Offset: 12 (8%), Referenced to phase 2:NBT and 6:SBTL, Start of Green

Natural Cycle: 110

Control Type: Actuated-Coordinated

Maximum v/c Ratio: 0.70

Intersection Signal Delay: 11.7

Intersection LOS: B

Intersection Capacity Utilization 70.7%

ICU Level of Service C

Analysis Period (min) 15

m Volume for 95th percentile queue is metered by upstream signal.

Splits and Phases: 3: US 15-501 &amp; Arlen Park Drive/Bennett Road

## **Appendix G – SIDRA Roundabout Analysis Output**

# LANE LEVEL OF SERVICE

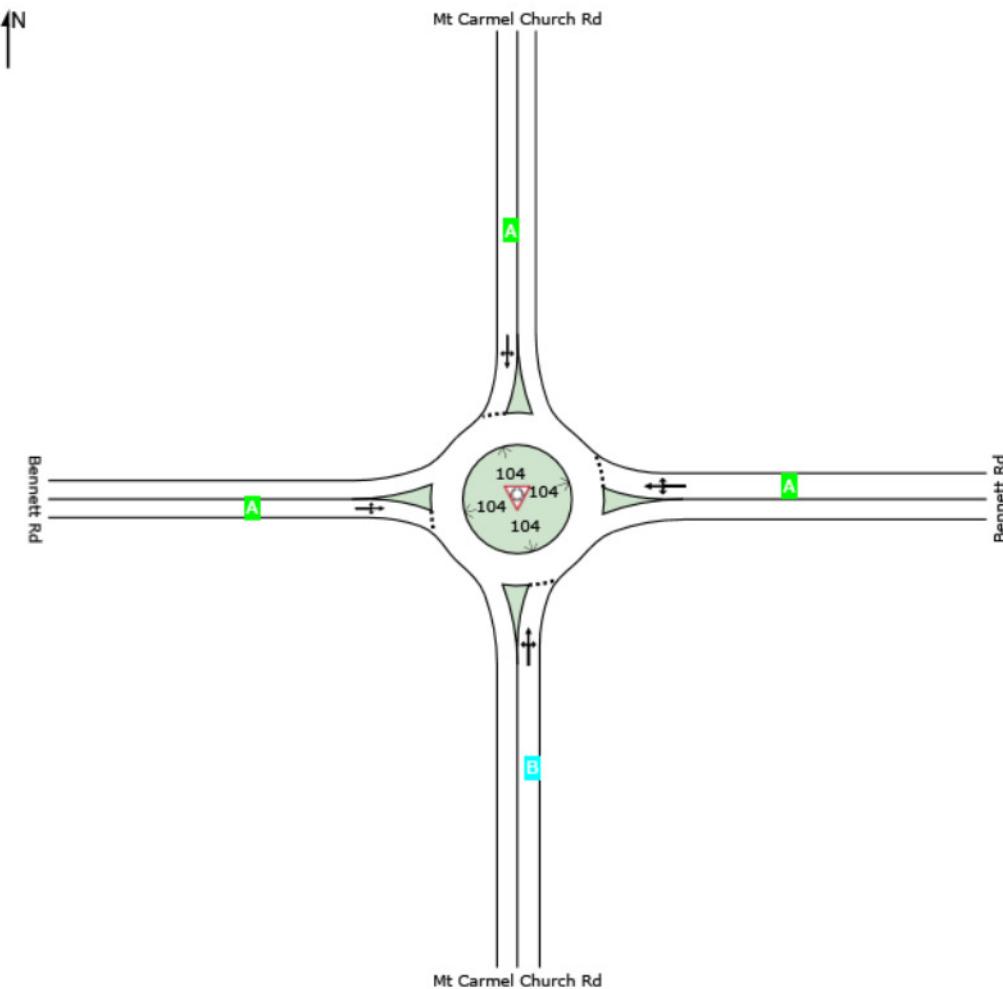

## Lane Level of Service

### Site: 101 [Mt Carmel Church\_Bennett 2017 Existing AM]

Mt Carmel Church Rd & Bennett Rd  
Roundabout

#### All Movement Classes

|     | South | East | North | West | Intersection |
|-----|-------|------|-------|------|--------------|
| LOS | B     | A    | A     | A    | A            |

Site Level of Service (LOS) Method: Delay & v/c (HCM 6). Site LOS Method is specified in the Parameter Settings dialog (Site tab).  
Roundabout LOS Method: Same as Sign Control.

Lane LOS values are based on average delay and v/c ratio (degree of saturation) per lane.

LOS F will result if v/c > 1 irrespective of lane delay value (does not apply for approaches and intersection).

Intersection and Approach LOS values are based on average delay for all lanes (v/c not used as specified in HCM 6).

HCM Delay Formula option is used. Control Delay does not include Geometric Delay since Exclude Geometric Delay option applies.

Site Level of Service (LOS) Method: Delay & v/c (HCM 6). Site LOS Method is specified in the Parameter Settings dialog (Site tab).

Roundabout LOS Method: Same as Sign Control.

Vehicle movement LOS values are based on average delay and v/c ratio (degree of saturation) per movement.

LOS F will result if v/c > 1 irrespective of movement delay value (does not apply for approaches and intersection).

Intersection and Approach LOS values are based on average delay for all movements (v/c not used as specified in HCM 6).

Roundabout Capacity Model: US HCM 6.

HCM Delay Formula option is used. Control Delay does not include Geometric Delay since Exclude Geometric Delay option applies.

Gap-Acceptance Capacity: Traditional M1.

HV (%) values are calculated for All Movement Classes of All Heavy Vehicle Model Designation.

Site Level of Service (LOS) Method: Delay & v/c (HCM 6). Site LOS Method is specified in the Parameter Settings dialog (Site tab).

Roundabout LOS Method: Same as Sign Control.

Vehicle movement LOS values are based on average delay and v/c ratio (degree of saturation) per movement.

LOS F will result if v/c > 1 irrespective of movement delay value (does not apply for approaches and intersection).

Intersection and Approach LOS values are based on average delay for all movements (v/c not used as specified in HCM 6).

Roundabout Capacity Model: US HCM 6.

HCM Delay Formula option is used. Control Delay does not include Geometric Delay since Exclude Geometric Delay option applies.

Gap-Acceptance Capacity: Traditional M1.

HV (%) values are calculated for All Movement Classes of All Heavy Vehicle Model Designation.

Site Level of Service (LOS) Method: Delay & v/c (HCM 6). Site LOS Method is specified in the Parameter Settings dialog (Site tab).  
Roundabout LOS Method: Same as Sign Control.

Lane LOS values are based on average delay and v/c ratio (degree of saturation) per lane.

LOS F will result if v/c > 1 irrespective of lane delay value (does not apply for approaches and intersection).

Intersection and Approach LOS values are based on average delay for all lanes (v/c not used as specified in HCM 6).

HCM Delay Formula option is used. Control Delay does not include Geometric Delay since Exclude Geometric Delay option applies.

Site Level of Service (LOS) Method: Delay & v/c (HCM 6). Site LOS Method is specified in the Parameter Settings dialog (Site tab).  
Roundabout LOS Method: Same as Sign Control.

Vehicle movement LOS values are based on average delay and v/c ratio (degree of saturation) per movement.

LOS F will result if v/c > 1 irrespective of movement delay value (does not apply for approaches and intersection).

Intersection and Approach LOS values are based on average delay for all movements (v/c not used as specified in HCM 6).

Roundabout Capacity Model: US HCM 6.

HCM Delay Formula option is used. Control Delay does not include Geometric Delay since Exclude Geometric Delay option applies.

Gap-Acceptance Capacity: Traditional M1.

HV (%) values are calculated for All Movement Classes of All Heavy Vehicle Model Designation.

# LANE LEVEL OF SERVICE

|-----|-------|------|-------|------|--------------|
| LOS | B     | A    | A     | A    | A            |

Site Level of Service (LOS) Method: Delay & v/c (HCM 6). Site LOS Method is specified in the Parameter Settings dialog (Site tab).  
Roundabout LOS Method: Same as Sign Control.

Lane LOS values are based on average delay and v/c ratio (degree of saturation) per lane.

LOS F will result if v/c > 1 irrespective of lane delay value (does not apply for approaches and intersection).

Intersection and Approach LOS values are based on average delay for all lanes (v/c not used as specified in HCM 6).

HCM Delay Formula option is used. Control Delay does not include Geometric Delay since Exclude Geometric Delay option applies.

| All Vehicles                      |        | 1603                     | 2.9  | 0.679         | 9.7               | LOS A            | 7.6                            | 193.5             | 0.43         | 0.26                        | 22.4              |

Site Level of Service (LOS) Method: Delay & v/c (HCM 6). Site LOS Method is specified in the Parameter Settings dialog (Site tab).  
Roundabout LOS Method: Same as Sign Control.

Vehicle movement LOS values are based on average delay and v/c ratio (degree of saturation) per movement.

LOS F will result if v/c > 1 irrespective of movement delay value (does not apply for approaches and intersection).

Intersection and Approach LOS values are based on average delay for all movements (v/c not used as specified in HCM 6).

Roundabout Capacity Model: US HCM 6.

HCM Delay Formula option is used. Control Delay does not include Geometric Delay since Exclude Geometric Delay option applies.

Gap-Acceptance Capacity: Traditional M1.

HV (%) values are calculated for All Movement Classes of All Heavy Vehicle Model Designation.

Site Level of Service (LOS) Method: Delay & v/c (HCM 6). Site LOS Method is specified in the Parameter Settings dialog (Site tab).  
Roundabout LOS Method: Same as Sign Control.

Vehicle movement LOS values are based on average delay and v/c ratio (degree of saturation) per movement.

LOS F will result if v/c > 1 irrespective of movement delay value (does not apply for approaches and intersection).

Intersection and Approach LOS values are based on average delay for all movements (v/c not used as specified in HCM 6).

Roundabout Capacity Model: US HCM 6.

HCM Delay Formula option is used. Control Delay does not include Geometric Delay since Exclude Geometric Delay option applies.

Gap-Acceptance Capacity: Traditional M1.

HV (%) values are calculated for All Movement Classes of All Heavy Vehicle Model Designation.

Site Level of Service (LOS) Method: Delay & v/c (HCM 6). Site LOS Method is specified in the Parameter Settings dialog (Site tab).  
Roundabout LOS Method: Same as Sign Control.

Lane LOS values are based on average delay and v/c ratio (degree of saturation) per lane.

LOS F will result if v/c > 1 irrespective of lane delay value (does not apply for approaches and intersection).

Intersection and Approach LOS values are based on average delay for all lanes (v/c not used as specified in HCM 6).

HCM Delay Formula option is used. Control Delay does not include Geometric Delay since Exclude Geometric Delay option applies.

Site Level of Service (LOS) Method: Delay & v/c (HCM 6). Site LOS Method is specified in the Parameter Settings dialog (Site tab).  
Roundabout LOS Method: Same as Sign Control.

Vehicle movement LOS values are based on average delay and v/c ratio (degree of saturation) per movement.

LOS F will result if v/c > 1 irrespective of movement delay value (does not apply for approaches and intersection).

Intersection and Approach LOS values are based on average delay for all movements (v/c not used as specified in HCM 6).

Roundabout Capacity Model: US HCM 6.

HCM Delay Formula option is used. Control Delay does not include Geometric Delay since Exclude Geometric Delay option applies.

Gap-Acceptance Capacity: Traditional M1.

HV (%) values are calculated for All Movement Classes of All Heavy Vehicle Model Designation.

Site Level of Service (LOS) Method: Delay & v/c (HCM 6). Site LOS Method is specified in the Parameter Settings dialog (Site tab).  
Roundabout LOS Method: Same as Sign Control.

Lane LOS values are based on average delay and v/c ratio (degree of saturation) per lane.

LOS F will result if v/c > 1 irrespective of lane delay value (does not apply for approaches and intersection).

Intersection and Approach LOS values are based on average delay for all lanes (v/c not used as specified in HCM 6).

HCM Delay Formula option is used. Control Delay does not include Geometric Delay since Exclude Geometric Delay option applies.

Site Level of Service (LOS) Method: Delay & v/c (HCM 6). Site LOS Method is specified in the Parameter Settings dialog (Site tab).  
Roundabout LOS Method: Same as Sign Control.

Vehicle movement LOS values are based on average delay and v/c ratio (degree of saturation) per movement.

LOS F will result if v/c > 1 irrespective of movement delay value (does not apply for approaches and intersection).

Intersection and Approach LOS values are based on average delay for all movements (v/c not used as specified in HCM 6).

Roundabout Capacity Model: US HCM 6.

HCM Delay Formula option is used. Control Delay does not include Geometric Delay since Exclude Geometric Delay option applies.

Gap-Acceptance Capacity: Traditional M1.

HV (%) values are calculated for All Movement Classes of All Heavy Vehicle Model Designation.

Site Level of Service (LOS) Method: Delay & v/c (HCM 6). Site LOS Method is specified in the Parameter Settings dialog (Site tab).  
Roundabout LOS Method: Same as Sign Control.

Vehicle movement LOS values are based on average delay and v/c ratio (degree of saturation) per movement.

LOS F will result if v/c > 1 irrespective of movement delay value (does not apply for approaches and intersection).

Intersection and Approach LOS values are based on average delay for all movements (v/c not used as specified in HCM 6).

Roundabout Capacity Model: US HCM 6.

HCM Delay Formula option is used. Control Delay does not include Geometric Delay since Exclude Geometric Delay option applies.

Gap-Acceptance Capacity: Traditional M1.

HV (%) values are calculated for All Movement Classes of All Heavy Vehicle Model Designation.

|-----|-------|------|-------|------|--------------|
| LOS | A     | A    | A     | A    | A            |

Site Level of Service (LOS) Method: Delay & v/c (HCM 6). Site LOS Method is specified in the Parameter Settings dialog (Site tab).  
Roundabout LOS Method: Same as Sign Control.

Lane LOS values are based on average delay and v/c ratio (degree of saturation) per lane.

LOS F will result if v/c > 1 irrespective of lane delay value (does not apply for approaches and intersection).

Intersection and Approach LOS values are based on average delay for all lanes (v/c not used as specified in HCM 6).

HCM Delay Formula option is used. Control Delay does not include Geometric Delay since Exclude Geometric Delay option applies.

Site Level of Service (LOS) Method: Delay & v/c (HCM 6). Site LOS Method is specified in the Parameter Settings dialog (Site tab).  
 Roundabout LOS Method: Same as Sign Control.

Vehicle movement LOS values are based on average delay and v/c ratio (degree of saturation) per movement.

LOS F will result if v/c > 1 irrespective of movement delay value (does not apply for approaches and intersection).

Intersection and Approach LOS values are based on average delay for all movements (v/c not used as specified in HCM 6).

Roundabout Capacity Model: US HCM 6.

HCM Delay Formula option is used. Control Delay does not include Geometric Delay since Exclude Geometric Delay option applies.

Gap-Acceptance Capacity: Traditional M1.

HV (%) values are calculated for All Movement Classes of All Heavy Vehicle Model Designation.

Site Level of Service (LOS) Method: Delay & v/c (HCM 6). Site LOS Method is specified in the Parameter Settings dialog (Site tab).  
Roundabout LOS Method: Same as Sign Control.

Lane LOS values are based on average delay and v/c ratio (degree of saturation) per lane.

LOS F will result if v/c > 1 irrespective of lane delay value (does not apply for approaches and intersection).

Intersection and Approach LOS values are based on average delay for all lanes (v/c not used as specified in HCM 6).

HCM Delay Formula option is used. Control Delay does not include Geometric Delay since Exclude Geometric Delay option applies.

Site Level of Service (LOS) Method: Delay & v/c (HCM 6). Site LOS Method is specified in the Parameter Settings dialog (Site tab).  
Roundabout LOS Method: Same as Sign Control.

Vehicle movement LOS values are based on average delay and v/c ratio (degree of saturation) per movement.

LOS F will result if v/c > 1 irrespective of movement delay value (does not apply for approaches and intersection).

Intersection and Approach LOS values are based on average delay for all movements (v/c not used as specified in HCM 6).

Roundabout Capacity Model: US HCM 6.

HCM Delay Formula option is used. Control Delay does not include Geometric Delay since Exclude Geometric Delay option applies.

Gap-Acceptance Capacity: Traditional M1.

HV (%) values are calculated for All Movement Classes of All Heavy Vehicle Model Designation.

## **Appendix H – Crash Data**

**North Carolina Department of Transportation  
Traffic Engineering Accident Analysis System  
Strip Analysis Report**

---

**Study Criteria Summary**

**County:** ORANGE      **City:** All and Rural  
**Date:** 09/01/2012    **to** 08/31/2017      **Study:** MTCARMELCHRDSTRIP  
**Location:** SR 1008 (Mt. Carmel Church Rd) from SR 1913 (Bennett Rd) to US 15-501

**Legend for Report Details:**  
 Acc No - Accident Number  
 Injuries: F - Fatal, A - Class A, B - Class B, C - Class C  
 Condition: R - Road Surface, L - Ambient Light, W - Weather  
 Rd Ch - Road Character  
 Rd Ci - Roadway Contributing Circumstances  
 Trfc Ctl - Traffic Control: Dv - Device, Op - Operating  
 Alchl/Drgs - Alcohol Drugs Suspected  
 Veh Mnvr/Ped Actn - Vehicle Maneuver/Pedestrian Action  
 Obj Strk - Object Struck

Acc No - Accident Number

Injuries: F - Fatal, A - Class A, B - Class B, C - Class C

**Legend for Report Details:**  
 Condition: R - Road Surface, L - Ambient Light, W - Weather  
 Rd Ch - Road Character

Rd Ci - Roadway Contributing Circumstances

Trfc Ctl - Traffic Control: Dv - Device, Op - Operating

Alchl/Drgs - Alcohol Drugs Suspected

Veh Mnvr/Ped Actn - Vehicle Maneuver/Pedestrian Action

Obj Strk - Object Struck
